

$$I(J^P) = \frac{1}{2}(0^-)$$

Quantum numbers not measured. Values shown are quark-model predictions.

See also the  $B^\pm/B^0$  ADMIXTURE and  $B^\pm/B_s^0/B_s^0/b$ -baryon ADMIXTURE sections.

## $B^\pm$ MASS

The fit uses  $m_{B^+}$ , ( $m_{B^0} - m_{B^+}$ ), and  $m_{B^0}$  to determine  $m_{B^+}$ ,  $m_{B^0}$ , and the mass difference.

<sup>1</sup> Uses  $B^+ \rightarrow J/\psi K^+$  fully reconstructed decays.

<sup>2</sup> Uses exclusively reconstructed final states containing a  $J/\psi \rightarrow \mu^+\mu^-$  decays.

<sup>3</sup> CSORNA 00 uses fully reconstructed 526  $B^+ \rightarrow J/\psi(\prime)K^+$  events and invariant masses without beam constraint.

<sup>4</sup> ALBRECHT 90J assumes 10580 for  $\Upsilon(4S)$  mass. Supersedes ALBRECHT 87C and ALBRECHT 87D.

<sup>5</sup> Found using fully reconstructed decays with  $J/\psi(1S)$ . ALBRECHT 87D assume  $m_{\Upsilon(4S)} = 10577$  MeV.

## $B^\pm$ MEAN LIFE

See  $B^\pm/B_s^0/b$ -baryon ADMIXTURE section for data on  $B$ -hadron mean life averaged over species of bottom particles.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

<sup>1</sup> Measured mean life using fully reconstructed decays ( $J/\psi K^{\pm}$ ).

<sup>2</sup> Measured using  $B^- \rightarrow D^0 \pi^-$  with  $D^0 \rightarrow K^- \pi^+$  events that were selected using a silicon vertex trigger.

<sup>3</sup> Measurement performed using a combined fit of  $CP$ -violation, mixing and lifetimes.

<sup>4</sup> Measurement performed using an inclusive reconstruction and  $B$  flavor identification technique.

<sup>5</sup> Measured mean life using fully reconstructed decays.

<sup>6</sup> Events are selected in which one  $B$  meson is fully reconstructed while the second  $B$  meson is reconstructed inclusively.

<sup>7</sup> Data analyzed using  $D/D^* \ell X$  event vertices.

<sup>8</sup> Data analyzed using charge of secondary vertex.

<sup>9</sup> ABREU 95Q assumes  $B(B^0 \rightarrow D^{*-} \ell^+ \nu_{\ell}) = 3.2 \pm 1.7\%$ .

<sup>10</sup> Data analyzed using vertex-charge technique to tag  $B$  charge.

<sup>11</sup> Combined result of  $D/D^* \ell X$  analysis and fully reconstructed  $B$  analysis.

<sup>12</sup> Combined ABREU 95Q and ADAM 95 result.

<sup>1</sup> Measured using  $B^{\pm} \rightarrow J/\psi K^{\pm}$  decays.

## B<sup>+</sup> DECAY MODES

B<sup>-</sup> modes are charge conjugates of the modes below. Modes which do not identify the charge state of the B are listed in the B<sup>±</sup>/B<sup>0</sup> ADMIXTURE section.

The branching fractions listed below assume 50% B<sup>0</sup> $\overline{B}^0$  and 50% B<sup>+</sup>B<sup>-</sup> production at the  $\Upsilon(4S)$ . We have attempted to bring older measurements up to date by rescaling their assumed  $\Upsilon(4S)$  production ratio to 50:50 and their assumed D, D<sub>s</sub>, D\*, and  $\psi$  branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, e.g.,  $B \rightarrow D^\pm X$ , the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction ( $\Gamma_i/\Gamma$ )	Scale factor/ Confidence level

[a] An  $\ell$  indicates an  $e$  or a  $\mu$  mode, not a sum over these modes.

[b] An  $CP(\pm 1)$  indicates the  $CP=+1$  and  $CP=-1$  eigenstates of the  $D^0$ - $\overline{D}^0$  system.

[c]  $D$  denotes  $D^0$  or  $\overline{D}^0$ .

[d]  $D_{CP+}^{*0}$  decays into  $D^0 \pi^0$  with the  $D^0$  reconstructed in  $CP$ -even eigenstates  $K^+ K^-$  and  $\pi^+ \pi^-$ .

[e]  $\overline{D}^{**}$  represents an excited state with  $2.2 < M < 2.8$  GeV/c<sup>2</sup>.

[f]  $\chi_{c1}(3872)^+$  is a hypothetical charged partner of the  $\chi_{c1}(3872)$ .

[g]  $\Theta(1710)^{++}$  is a possible narrow pentaquark state and  $G(2220)$  is a possible glueball resonance.

[h]  $(\overline{\Lambda}_c^- p)_s$  denotes a low-mass enhancement near 3.35 GeV/c<sup>2</sup>.

## CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 6 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 3.7$  for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$$x_{416} \begin{array}{|c} \hline 10 \\ \hline \end{array} x_{355}$$

---

## CONSTRAINED FIT INFORMATION

An overall fit to 18 branching ratios uses 59 measurements and one constraint to determine 12 parameters. The overall fit has a  $\chi^2 = 64.7$  for 48 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$11.15 \pm 0.26 \pm 0.41$	<sup>4</sup> OKABE 05	BELL	Repl. by URQUIJO 07
$10.1 \pm 1.8 \pm 1.5$	ATHANAS 94	CLE2	Sup. by ARTUSO 97

<sup>1</sup> URQUIJO 07 report a measurement of  $(10.34 \pm 0.23 \pm 0.25)\%$  for the partial branching fraction of  $B^+ \rightarrow e^+ \nu_e X_C$  decay with electron energy above 0.6 GeV. We converted the result to  $B^+ \rightarrow e^+ \nu_e X$  branching fraction.

<sup>2</sup> The measurements are obtained for charged and neutral  $B$  mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the  $B$  rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV:  $B(B^+ \rightarrow e^+ \nu_e X) / B(B^0 \rightarrow e^+ \nu_e X) = 1.074 \pm 0.041 \pm 0.026$ .

<sup>3</sup> ARTUSO 97 uses partial reconstruction of  $B \rightarrow D^* \ell \nu_\ell$  and inclusive semileptonic branching ratio from BARISH 96B ( $0.1049 \pm 0.0017 \pm 0.0043$ ).

<sup>4</sup> The measurements are obtained for charged and neutral  $B$  mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the  $B$  rest frame, and their ratio of  $B(B^+ \rightarrow e^+ \nu_e X)/B(B^0 \rightarrow e^+ \nu_e X) = 1.08 \pm 0.05 \pm 0.02$ .

$$\Gamma(\bar{D}^*(2007)^0 \ell^+ \nu_\ell) / \Gamma_{\text{total}}$$

$$\Gamma_7/\Gamma$$

<sup>1</sup> Measured using the dependence of  $B^- \rightarrow D^{*0} e^- \bar{\nu}_e$  decay differential rate and the form factor description by CAPRINI 98.

<sup>2</sup> Simultaneous measurements of both  $B^0 \rightarrow D^*(2010)^- \ell \nu$  and  $B^+ \rightarrow \bar{D}(2007)^0 \ell \nu$ .

<sup>3</sup> ALBRECHT 92C reports  $0.058 \pm 0.014 \pm 0.013$ . We rescale using the method described in STONE 94 but with the updated PDG 94  $B(D^0 \rightarrow K^- \pi^+)$ . Assumes equal production of  $B^0 \bar{B}^0$  and  $B^+ B^-$  at the  $\Upsilon(4S)$ .

<sup>4</sup> Uses a fully reconstructed  $B$  meson as a tag on the recoil side.

<sup>5</sup> The results are based on the same analysis and data sample reported in ADAM 03.

<sup>6</sup> BARISH 95 use  $B(D^0 \rightarrow K^- \pi^+) = (3.91 \pm 0.08 \pm 0.17)\%$  and  $B(D^{*0} \rightarrow D^0 \pi^0) = (63.6 \pm 2.3 \pm 3.3)\%$ .

<sup>7</sup> Combining  $D^{*0} \ell^+ \nu_\ell$  and  $\bar{D}^{*-} \ell^+ \nu_\ell$  SANGHERA 93 test  $V-A$  structure and fit the decay angular distributions to obtain  $A_{FB} = 3/4(\Gamma^- - \Gamma^+)/\Gamma = 0.14 \pm 0.06 \pm 0.03$ . Assuming a value of  $V_{cb}$ , they measure  $V$ ,  $A_1$ , and  $A_2$ , the three form factors for the  $D^* \ell \nu_\ell$  decay, where results are slightly dependent on model assumptions.

<sup>8</sup> Assumes equal production of  $B^0 \bar{B}^0$  and  $B^+ B^-$  at the  $\Upsilon(4S)$ . Uncorrected for  $D$  and  $D^*$  branching ratio assumptions.

<sup>9</sup> ANTREASYAN 90B is average over  $B$  and  $\bar{D}^*(2010)$  charge states.

$1.2 \pm 0.2^{+0.3}_{-0.4}$	<sup>4</sup> ALEXANDER	96T CLE2	$e^+ e^- \rightarrow \Upsilon(4S)$
<2.1	90	<sup>5</sup> BEAN	93B CLE2 $e^+ e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> The signal events are tagged by a second  $B$  meson reconstructed in the fully hadronic decays.

<sup>2</sup>  $B^+$  and  $B^0$  decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.

<sup>3</sup> The signal events are tagged by a second  $B$  meson reconstructed in the semileptonic mode  $B \rightarrow D^{(*)} \ell \nu_\ell$ .

<sup>4</sup> Derived based in the reported  $B^0$  result by assuming isospin symmetry:  $\Gamma(B^0 \rightarrow \rho^- \ell^+ \nu) = 2\Gamma(B^+ \rightarrow \rho^0 \ell^+ \nu) \approx 2\Gamma(B^+ \rightarrow \omega \ell^+ \nu)$ .

<sup>5</sup> BEAN 93B limit set using ISGW Model. Using isospin and the quark model to combine  $\Gamma(\omega^0 \ell^+ \nu_\ell)$  and  $\Gamma(\rho^- \ell^+ \nu_\ell)$  with this result, they obtain a limit  $<(1.6\text{--}2.7) \times 10^{-4}$  at 90% CL for  $B^+ \rightarrow \rho^0 \ell^+ \nu_\ell$ . The range corresponds to the ISGW, WSB, and KS models. An upper limit on  $|V_{ub}/V_{cb}| < 0.8\text{--}0.13$  at 90% CL is derived as well.

<sup>1</sup> Requires one reconstructed semileptonic  $B$  decay  $B^- \rightarrow D^{(*)0} \ell^- \bar{\nu}_\ell$  in the recoil.

<sup>2</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$ .

<sup>3</sup> The authors combine their result with that from HARA 10 obtaining  $B(B^- \rightarrow \tau^- \bar{\nu}_\tau) = (0.96 \pm 0.26) \times 10^{-4}$  and deriving  $f_B |V_{ub}| = (7.4 \pm 0.8 \pm 0.5) \times 10^{-4}$  GeV.

<sup>4</sup> Requires a fully reconstructed hadronic  $B$ -decay in the recoil. Reports that this result combined with AUBERT 10E value gives  $B(B^- \rightarrow \tau^- \bar{\nu}_\tau) = (1.79 \pm 0.48) \times 10^{-4}$ .

<sup>5</sup> Requires one reconstructed semileptonic  $B$  decay  $B^- \rightarrow D^0 \ell^- \bar{\nu}_\ell X$  in the recoil.

<sup>6</sup> Requires one reconstructed semileptonic  $B$  decay  $B^- \rightarrow D^{(*)0} \ell^- \bar{\nu}_\ell X$  in the recoil.

<sup>7</sup> The analysis is based on a sample of events with one fully reconstructed tag  $B$  in a hadronic decay mode  $B^- \rightarrow D^{(*)0} X^-$ .

<sup>8</sup> The energy-flow and  $b$ -tagging algorithms were used.

<sup>9</sup> ACCIARRI 97F uses missing-energy technique and  $f(b \rightarrow B^-) = (38.2 \pm 2.5)\%$ .

<sup>10</sup> ALBRECHT 95D uses full reconstruction of one  $B$  decay as tag.

<sup>11</sup> BUSKULIC 95 uses same missing-energy technique as in  $\bar{B} \rightarrow \tau^+ \nu_\tau X$ , but analysis is restricted to endpoint region of missing-energy distribution.

1.9 $\pm 1.0 \pm 0.6$	7	<sup>10</sup> ALBRECHT 88K	ARG	$e^+e^- \rightarrow \gamma(4S)$

<sup>1</sup> Measures absolute branching fractions using a missing-mass technique.

<sup>2</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$ .

<sup>3</sup> ABULENCIA 06J reports  $[\Gamma(B^+ \rightarrow \overline{D}^0\pi^+)/\Gamma_{\text{total}}] / [B(B^0 \rightarrow D^-\pi^+)] = 1.97 \pm 0.10 \pm 0.21$  which we multiply by our best value  $B(B^0 \rightarrow D^-\pi^+) = (2.51 \pm 0.08) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup> Uses a missing-mass method. Does not depend on  $D$  branching fractions or  $B^+/B^0$  production rates.

<sup>5</sup> AHMED 02B reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of  $B^0$  and  $B^+$ , which is not included here.

<sup>6</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$  and uses the Mark III branching fractions for the  $D$ .

<sup>7</sup> BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.

<sup>8</sup> AUBERT,B 04P reports  $[\Gamma(B^+ \rightarrow \overline{D}^0\pi^+)/\Gamma_{\text{total}}] \times [B(D^0 \rightarrow K^-\pi^+)] = (1.846 \pm 0.032 \pm 0.097) \times 10^{-4}$  which we divide by our best value  $B(D^0 \rightarrow K^-\pi^+) = (3.947 \pm 0.030) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>9</sup> ALAM 94 assume equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$  and use the CLEO II absolute  $B(D^0 \rightarrow K^-\pi^+)$  and the PDG 1992  $B(D^0 \rightarrow K^-\pi^+\pi^0)/B(D^0 \rightarrow K^-\pi^+)$  and  $B(D^0 \rightarrow K^-2\pi^+\pi^-)/B(D^0 \rightarrow K^-\pi^+)$ .

<sup>10</sup> ALBRECHT 88K assumes  $B^0\overline{B}^0:B^+B^-$  ratio is 45:55. Superseded by ALBRECHT 90J.

$\Gamma(\overline{D}^0\rho^+)/\Gamma_{\text{total}}$				$\Gamma_{54}/\Gamma$

<sup>1</sup> Uses the ratio of  $B^- \rightarrow [K^+ \pi^-]_D K^-$  and  $B^- \rightarrow [K^- \pi^+]_D K^+$ . AAIJ 21Q gives the charge-averaged rate as  $0.0173 \pm 0.0006$ , where the statistical and systematic uncertainties have been combined according to the correlations between the observables.

<sup>2</sup> Uses the ratio of  $B^+ \rightarrow [K^- \pi^+]_D K^+$  and  $B^+ \rightarrow [K^+ \pi^-]_D K^+$ . AAIJ 21Q gives the charge-averaged rate as  $0.0173 \pm 0.0006$ , where the statistical and systematic uncertainties have been combined according to the correlations between the observables.

<sup>3</sup> AALTONEN 11AJ also measures the ratio separately for  $B^+$  ( $R^+(K)$ ) and  $B^-$  ( $R^-(K)$ ) and obtains:  $R^+(K) = (42.6 \pm 13.7 \pm 2.8) \times 10^{-3}$ ,  $R^-(K) = (3.8 \pm 10.3 \pm 2.7) \times 10^{-3}$ .

<sup>4</sup> Superseded by AAIJ 21Q.

<sup>5</sup> AUBERT 05G extract a constraint on the magnitude of the ratio of amplitudes  $|A(B^+ \rightarrow D^0 K^+) / A(B^+ \rightarrow \bar{D}^0 K^+)| < 0.23$  at 90% CL (Bayesian). Similar measurements from  $B^+ \rightarrow D^{*0} K^+$  are also reported.

<sup>6</sup> SAIGO 05 extract a constraint on the magnitude of the ratio of amplitudes  $|A(B^+ \rightarrow D^0 K^+) / A(B^+ \rightarrow \bar{D}^0 K^+)| < 0.27$  at 90% CL.

<sup>7</sup> AUBERT,B 04L extract a constraint on the magnitude of the ratio of amplitudes  $|A(B^+ \rightarrow D^0 K^+)/A(B^+ \rightarrow \bar{D}^0 K^+)| < 0.22$  at 90% CL.

<sup>1</sup> Uses the ratio of  $B^- \rightarrow [K^+\pi^-]_D K^-$  and  $B^- \rightarrow [K^-\pi^+]_D K^-$ . AAIJ 21Q gives the charge-averaged rate as  $0.00368 \pm 0.00007$ , where the statistical and systematic uncertainties have been combined according to the correlations between the observables.

<sup>2</sup> Uses the ratio of  $B^+ \rightarrow [K^-\pi^+]_D \pi^+$  and  $B^+ \rightarrow [K^+\pi^-]_D \pi^+$ . AAIJ 21Q gives the charge-averaged rate as  $0.00368 \pm 0.00007$ , where the statistical and systematic uncertainties have been combined according to the correlations between the observables.

<sup>3</sup> AALTONEN 11AJ also measures the ratio separately for  $B^+$  ( $R^+(\pi)$ ) and  $B^-$  ( $R^-(\pi)$ ) and obtains:  $R^+(\pi) = (2.4 \pm 1.0 \pm 0.4) \times 10^{-3}$ ,  $R^-(K) = (3.1 \pm 1.1 \pm 0.4) \times 10^{-3}$ .

<sup>4</sup> Superseded by AAIJ 21Q.

5. ± 2. ± 3.	7	6	ALBRECHT	87C	ARG	$e^+e^- \rightarrow \gamma(4S)$

<sup>1</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$ .

<sup>2</sup> ALAM 94 assume equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$  and use the CLEO II  $B(D^*(2010)^+ \rightarrow D^0\pi^+)$  and absolute  $B(D^0 \rightarrow K^-\pi^+)$  and the PDG 1992  $B(D^0 \rightarrow K^-\pi^+\pi^0)/B(D^0 \rightarrow K^-\pi^+)$  and  $B(D^0 \rightarrow K^-\pi^+\pi^-)/B(D^0 \rightarrow K^-\pi^+)$ .

<sup>3</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$  and uses the Mark III branching fractions for the  $D$ .

<sup>4</sup> BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.

<sup>5</sup> BORTOLETTO 92 assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$  and uses Mark III branching fractions for the  $D$  and  $D^*(2010)$ . The authors also find the product branching fraction into  $D^{**}\pi$  followed by  $D^{**} \rightarrow D^*(2010)\pi$  to be  $0.0014^{+0.0008}_{-0.0006} \pm 0.0003$  where  $D^{**}$  represents all orbitally excited  $D$  mesons.

<sup>6</sup> ALBRECHT 87C use PDG 86 branching ratios for  $D$  and  $D^*(2010)$  and assume  $B(\Upsilon(4S) \rightarrow B^+ B^-) = 55\%$  and  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = 45\%$ . Superseded by ALBRECHT 90J.

<sup>2</sup> ACOSTA 02F uses as reference of  $B(B \rightarrow J/\psi(1S) K^+) = (10.1 \pm 0.6) \times 10^{-4}$ . The second error includes the systematic error and the uncertainties of the branching ratio.

<sup>3</sup> BORTOLETTO 92 reports  $(1.2 \pm 0.6 \pm 0.4) \times 10^{-3}$  from a measurement of  $[\Gamma(B^+ \rightarrow J/\psi(1S) K^+ \pi^+ \pi^-)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+ e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+ e^-) = 0.069 \pm 0.009$ , which we rescale to our best value  $B(J/\psi(1S) \rightarrow e^+ e^-) = (5.971 \pm 0.032) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>4</sup> ALBRECHT 87D reports  $(1.2 \pm 0.8) \times 10^{-3}$  from a measurement of  $[\Gamma(B^+ \rightarrow J/\psi(1S) K^+ \pi^+ \pi^-)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+ e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+ e^-) = 0.069 \pm 0.009$ , which we rescale to our best value  $B(J/\psi(1S) \rightarrow e^+ e^-) = (5.971 \pm 0.032) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. They actually report  $0.0011 \pm 0.0007$  assuming  $B^+ B^- / B^0 \bar{B}^0$  ratio is 55/45. We rescale to 50/50. Analysis explicitly removes  $B^+ \rightarrow \psi(2S) K^+$ .

<sup>5</sup> ALBRECHT 90J reports  $< 1.6 \times 10^{-3}$  from a measurement of  $[\Gamma(B^+ \rightarrow J/\psi(1S) K^+ \pi^+ \pi^-)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+ e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+ e^-) = 0.069$ , which we rescale to our best value  $B(J/\psi(1S) \rightarrow e^+ e^-) = 5.971 \times 10^{-2}$ . Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

COMMENT

our best values  $B(\psi(2S) \rightarrow p\bar{p}) = (2.94 \pm 0.08) \times 10^{-4}$ ,  $B(J/\psi(1S) \rightarrow p\bar{p}) = (2.120 \pm 0.029) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.

<sup>2</sup> AAIJ 12L reports  $0.594 \pm 0.006 \pm 0.016 \pm 0.015$  from a measurement of  $[\Gamma(B^+ \rightarrow \psi(2S) K^+)/\Gamma(B^+ \rightarrow J/\psi(1S) K^+)] \times [B(J/\psi(1S) \rightarrow e^+ e^-)] / [B(\psi(2S) \rightarrow e^+ e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+ e^-) = (5.94 \pm 0.06) \times 10^{-2}$ ,  $B(\psi(2S) \rightarrow e^+ e^-) = (7.72 \pm 0.17) \times 10^{-3}$ , which we rescale to our best values  $B(J/\psi(1S) \rightarrow e^+ e^-) = (5.971 \pm 0.032) \times 10^{-2}$ ,  $B(\psi(2S) \rightarrow e^+ e^-) = (7.93 \pm 0.17) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.

<sup>3</sup> Assumes  $B(J/\psi \rightarrow \mu^+ \mu^-) / B(\psi(2S) \rightarrow \mu^+ \mu^-) = B(J/\psi \rightarrow e^+ e^-) / B(\psi(2S) \rightarrow e^+ e^-) = 7.69 \pm 0.19$ .

<sup>4</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$ .

<sup>1</sup> LEES 20C measurement's last uncertainty is due to the used  $B(B^\pm \rightarrow K^\pm J/\psi)$  value.

<sup>2</sup> Measures absolute branching fractions using a missing-mass technique.

<sup>3</sup> CHILIKIN 19 reports  $[\Gamma(B^+ \rightarrow \chi_{c0}K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \rightarrow p\bar{p}\pi^+\pi^-)] = (3.7^{+1.2+0.2}_{-1.0-0.3}) \times 10^{-7}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow p\bar{p}\pi^+\pi^-) = (2.1 \pm 0.7) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$ .

<sup>5</sup> Measured in the  $B^+ \rightarrow K^+K^-K^+$  decay.

<sup>6</sup> Measured in the  $B^+ \rightarrow K^+ K_S^0 K_S^0$  decay.

<sup>7</sup> LEES 11I reports  $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \rightarrow \pi\pi)] = (1.53 \pm 0.66 \pm 0.27) \times 10^{-6}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow \pi\pi) = (8.51 \pm 0.33) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>8</sup> AUBERT 08AI reports  $(0.70 \pm 0.10 \pm 0.12) \times 10^{-6}$  for  $B(B^+ \rightarrow \chi_{c0} K^+) \times B(\chi_{c0} \rightarrow \pi^+ \pi^-)$ . We compute  $B(B^+ \rightarrow \chi_{c0} K^+)$  using the PDG value  $B(\chi_{c0} \rightarrow \pi\pi) = (8.51 \pm 0.33) \times 10^{-3}$  and 2/3 for the  $\pi^+ \pi^-$  fraction. Our first error is their experiment's error and the second error is systematic error from using our best value.

<sup>9</sup> AUBERT,BE 06M reports  $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \rightarrow \gamma J/\psi(1S))] = (6.1 \pm 2.6 \pm 1.1) \times 10^{-6}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow \gamma J/\psi(1S)) = (1.40 \pm 0.05) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. The significance of the observed signal is  $2.4\sigma$ .

<sup>10</sup> AAIJ 13S reports  $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \rightarrow p\bar{p})] < 6 \times 10^{-8}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow p\bar{p}) = 2.21 \times 10^{-4}$ .

<sup>11</sup> WICHT 08 reports  $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \rightarrow \gamma\gamma)] < 0.11 \times 10^{-6}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow \gamma\gamma) = 2.04 \times 10^{-4}$ .

<sup>12</sup> Measured in the  $B^+ \rightarrow K^+ K^- K^+$  decay.

<sup>13</sup> AUBERT,B 05N reports  $(0.66 \pm 0.22 \pm 0.08) \times 10^{-6}$  for  $B(B^+ \rightarrow \chi_c^0 K^+) \times B(\chi_c^0 \rightarrow \pi^+ \pi^-)$ . We compute  $B(B^+ \rightarrow \chi_c^0 K^+)$  using the PDG value  $B(\chi_c^0 \rightarrow \pi^+ \pi^-) = (7.1 \pm 0.6) \times 10^{-3}$  and 2/3 for the  $\pi^+ \pi^-$  fraction.

<sup>14</sup> The measurement performed using decay channels  $\chi_{c0} \rightarrow \pi^+ \pi^-$  and  $\chi_{c0} \rightarrow K^+ K^-$ . The ratio of the branching ratios for these channels is found to be consistent with world average.

<sup>15</sup> AUBERT 04P reports  $B(B^+ \rightarrow \chi_{c0} K^+) \times B(\chi_{c0} \rightarrow \pi^+ \pi^-) = (1.5 \pm 0.4 \pm 0.1) \times 10^{-6}$  and used PDG value of  $B(\chi_{c0} \rightarrow \pi\pi) = (7.4 \pm 0.8) \times 10^{-3}$  and Clebsh-Gordan coefficient to compute  $B(B^+ \rightarrow \chi_{c0} K^+)$ .

<sup>16</sup> ABE 02B measures the ratio of  $B(B^+ \rightarrow \chi_{c0} K^+)/B(B^+ \rightarrow J/\psi(1S) K^+) = 0.60 + 0.21 - 0.18 \pm 0.05 \pm 0.08$ , where the third error is due to the uncertainty in the  $B(\chi_{c0} \rightarrow \pi^+ \pi^-)$ , and uses  $B(B^+ \rightarrow J/\psi(1S) K^+) = (10.0 \pm 1.0) \times 10^{-4}$  to obtain the result.

<sup>17</sup> EDWARDS 01 assumes equal production of  $B^0$  and  $B^+$  at the  $\Upsilon(4S)$ . The correlated uncertainties (28.3)% from  $B(J/\psi(1S) \rightarrow \gamma\eta_c)$  in those modes have been accounted for.

<sup>1</sup> Measures absolute branching fractions using a missing-mass technique.

<sup>2</sup> LEES 20C measurement's last uncertainty is due to the used  $B(B^\pm \rightarrow K^\pm J/\psi)$  value.

<sup>3</sup> CHILIKIN 19 reports  $[\Gamma(B^+ \rightarrow \chi_{c1}(1P)K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c1}(1P) \rightarrow p\bar{p}\pi^+\pi^-)] = (4.7^{+1.3+0.4}_{-1.2-0.2}) \times 10^{-7}$  which we divide by our best value  $B(\chi_{c1}(1P) \rightarrow p\bar{p}\pi^+\pi^-)$

=  $(5.0 \pm 1.9) \times 10^{-4}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$ .

<sup>5</sup> Uses  $\chi_{c1,2} \rightarrow J/\psi\gamma$ . Assumes  $B(\gamma(4S) \rightarrow B^+B^-) = (51.6 \pm 0.6)\%$  and  $B(\gamma(4S) \rightarrow B^0\bar{B}^0) = (48.4 \pm 0.6)\%$ .

<sup>6</sup> ACOSTA 02F uses as reference of  $B(B \rightarrow J/\psi(1S)K^+) = (10.1 \pm 0.6) \times 10^{-4}$ . The second error includes the systematic error and the uncertainties of the branching ratio.

<sup>7</sup> AUBERT,BE 06M reports  $[\Gamma(B^+ \rightarrow \chi_{c1}(1P)K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S))] = (1.76 \pm 0.07 \pm 0.12) \times 10^{-4}$  which we divide by our best value

$B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S)) = (34.3 \pm 1.0) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>8</sup> AUBERT 02 reports  $(7.5 \pm 0.9 \pm 0.8) \times 10^{-4}$  from a measurement of  $[\Gamma(B^+ \rightarrow \chi_{c1}(1P)K^+)/\Gamma_{\text{total}}] \times [B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S))]$  assuming  $B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S)) = 0.273 \pm 0.016$ , which we rescale to our best value  $B(\chi_{c1}(1P) \rightarrow \gamma J/\psi(1S)) = (34.3 \pm 1.0) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$ .

<sup>9</sup> ALBRECHT 92E assumes no  $\chi_{c2}(1P)$  production and  $B(\gamma(4S) \rightarrow B^+B^-) = 50\%$ .

• • • We do not use the following data for averages, fits, limits, etc. • • •

<71 90 <sup>3</sup> GODANG 02 CLE2  $e^+ e^- \rightarrow \gamma(4S)$

<sup>1</sup> Signal significance is 2.7 standard deviations. This measurement corresponds to an upper limit of  $< 1.31 \times 10^{-6}$  at 90% CL.

<sup>2</sup> Signal significance is 3.7 standard deviations.

<sup>3</sup> Assumes a helicity 00 configuration. For a helicity 11 configuration, the limit decreases to  $4.8 \times 10^{-5}$ .

4.09 $\pm 1.28 {}^{+0.04}_{-0.14}$	<sup>3,4</sup> AUBERT,B	05G	BABR	Repl. by AUBERT 09L
< 240	90	<sup>5</sup> BORTOLETTO89	CLEO	$e^+ e^- \rightarrow \gamma(4S)$

<sup>1</sup> AAIJ 19AL reports  $0.075 \pm 0.008 \pm 0.007$  fit fraction for  $B^+ \rightarrow f_2(1270)\pi^+$  from the amplitude analysis of  $B^\pm \rightarrow \pi^\pm K^+ K^-$  decays. We use the PDG 19 value

$B(B^+ \rightarrow K^+ K^- \pi^+) = (5.2 \pm 0.4) \times 10^{-6}$  to obtain  $B(B^+ \rightarrow f_2(1270)\pi^+, f_2(1270) \rightarrow K^+ K^-)$ . We compute  $B(B^+ \rightarrow f_2(1270)\pi^+)$  using 1/2 of PDG 19 value of  $B(f_2(1270) \rightarrow K\bar{K}) = (4.6^{+0.5}_{-0.4})\%$  for  $K^+ K^-$  fraction. Our first error is the experiment's error and the second error is systematic error from using our best value.

<sup>2</sup>AUBERT 09L reports  $[\Gamma(B^+ \rightarrow \pi^+ f_2(1270))/\Gamma_{\text{total}}] \times [B(f_2(1270) \rightarrow \pi^+ \pi^-)] = (0.9 \pm 0.2 \pm 0.1^{+0.3}_{-0.1}) \times 10^{-6}$  which we divide by our best value  $B(f_2(1270) \rightarrow \pi^+ \pi^-) = (56.2^{+1.9}_{-0.6}) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>3</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$ .

<sup>4</sup>AUBERT,B 05G reports  $[\Gamma(B^+ \rightarrow \pi^+ f_2(1270))/\Gamma_{\text{total}}] \times [B(f_2(1270) \rightarrow \pi^+ \pi^-)] = (2.3 \pm 0.6 \pm 0.4) \times 10^{-6}$  which we divide by our best value  $B(f_2(1270) \rightarrow \pi^+ \pi^-) = (56.2^{+1.9}_{-0.6}) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>5</sup>BORTOLETTO 89 reports  $< 2.1 \times 10^{-4}$  assuming the  $\gamma(4S)$  decays 43% to  $B^0 \bar{B}^0$ . We rescale to 50%.

<8 90 <sup>1,3</sup> DYTMAN 02 CLE2  $e^+ e^- \rightarrow \gamma(4S)$

<9.3 90 <sup>1,4</sup> GABYSHEV 02 BELL Repl. by GABYSHEV 06A

<sup>1</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$ .

<sup>2</sup> GABYSHEV 06A reports  $(3.7 \pm 0.7 \pm 0.4) \times 10^{-5}$  from a measurement of  $[\Gamma(B^+ \rightarrow \bar{\Sigma}_c(2455)^0 p)/\Gamma_{\text{total}}] \times [B(\Lambda_c^+ \rightarrow p K^- \pi^+)]$  assuming  $B(\Lambda_c^+ \rightarrow p K^- \pi^+) = 0.05$ ,

which we rescale to our best value  $B(\Lambda_c^+ \rightarrow p K^- \pi^+) = (6.26 \pm 0.29) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>3</sup> DYTMAN 02 measurement uses  $B(\Lambda_c^- \rightarrow \bar{p} K^+ \pi^-) = 5.0 \pm 1.3\%$ . The second error includes the systematic and the uncertainty of the branching ratio.

<sup>4</sup> Uses the value for  $\Lambda_c^- \rightarrow p K^- \pi^+$  branching ratio  $(5.0 \pm 1.3)\%$ .

<sup>1</sup> Uses  $B(B^+ \rightarrow J/\psi(1S) K^+) = (0.998 \pm 0.014 \pm 0.040) \times 10^{-3}$  for normalization.

<sup>2</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\gamma(4S)$ .

<sup>3</sup> Uses  $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$ .

<sup>4</sup> Superseded by CHOUDHURY 21.

<sup>5</sup> Assumes equal production of  $B^0$  and  $B^+$  at  $\gamma(4S)$ . The second error is a total of systematic uncertainties including model dependence.

<sup>6</sup> The result is for di-lepton masses above 0.5 GeV.

<sup>7</sup> AFFOLDER 99B measured relative to  $B^+ \rightarrow J/\psi(1S) K^+$ .

<sup>8</sup> ABE 96L measured relative to  $B^+ \rightarrow J/\psi(1S) K^+$  using PDG 94 branching ratios.

<sup>9</sup> ALBRECHT 91E reports  $< 2.2 \times 10^{-4}$  assuming the  $\gamma(4S)$  decays 45% to  $B^0 \bar{B}^0$ . We rescale to 50%.

<sup>10</sup> WEIR 90B assumes  $B^+$  production cross section from LUND.

<sup>11</sup> AVERY 89B reports  $< 1.5 \times 10^{-4}$  assuming the  $\gamma(4S)$  decays 43% to  $B^0 \bar{B}^0$ . We rescale to 50%.

<sup>12</sup> AVERY 87 reports  $< 3.2 \times 10^{-4}$  assuming the  $\gamma(4S)$  decays 40% to  $B^0 \bar{B}^0$ . We rescale to 50%.

## POLARIZATION IN $B^+$ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ( $L$ ) or both are transverse and parallel ( $\parallel$ ) or perpendicular ( $\perp$ ) to each other with the parameters  $\Gamma_L/\Gamma$ ,  $\Gamma_\perp/\Gamma$ , and the relative phases  $\phi_\parallel$  and  $\phi_\perp$ . See the definitions in the note on “Polarization in  $B$  Decays” review in the  $B^0$  Particle Listings.

## CP VIOLATION

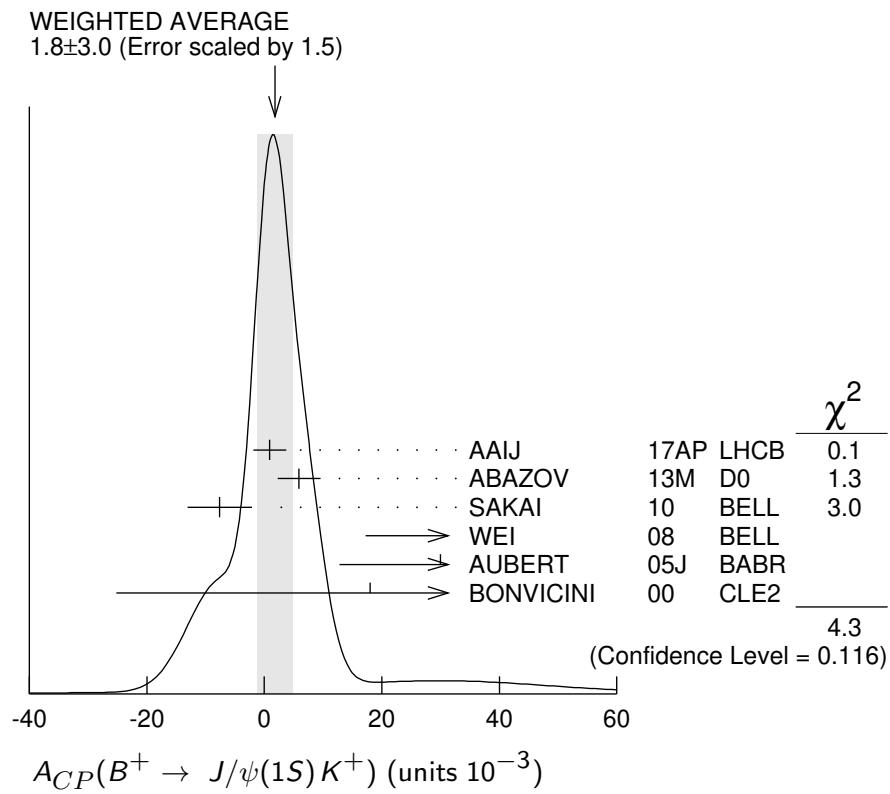

$A_{CP}$  is defined as

$$\frac{B(B^- \rightarrow \bar{f}) - B(B^+ \rightarrow f)}{B(B^- \rightarrow \bar{f}) + B(B^+ \rightarrow f)},$$

the CP-violation charge asymmetry of exclusive  $B^-$  and  $B^+$  decay.

$-0.39 \pm 0.33 \pm 0.12$	AUBERT	03M	BABR	Repl. by AUBERT 05G

<sup>1</sup> AAIJ 14BO reports also  $CP$  asymmetries in restricted regions of phase space.

<sup>2</sup> AAIJ 14 reports  $A_{CP}(B^+ \rightarrow \pi^+ \pi^- \pi^+) = 0.584 \pm 0.082 \pm 0.027 \pm 0.007$  in the Dalitz plot region of  $m_{\pi^+ \pi^-}^2 > 15 \text{ GeV}^2/c^4$  or  $m_{\pi^+ \pi^-}^2 < 0.4 \text{ GeV}^2/c^4$ . The third uncertainty is due to the  $CP$  asymmetry of the  $B^\pm \rightarrow J/\psi K^\pm$  reference mode uncertainty.

## CP VIOLATION PARAMETERS IN $B^+ \rightarrow D K^+$ AND SIMILAR DECAYS

---

The parameters  $r_{B^+}$  and  $\delta_{B^+}$  are the magnitude ratio and strong phase difference between the amplitudes of  $A(B^+ \rightarrow \bar{D}^{(*)0} K^{(*)+})$  and  $A(B^- \rightarrow D^{(*)0} K^{(*)-})$ . The measured observables are defined as  $x_{\pm} = r_{B^+} \cos(\delta_{B^+} \pm \gamma)$  and  $y_{\pm} = r_{B^+} \sin(\delta_{B^+} \pm \gamma)$ , and can be used to measure the CKM angle  $\gamma$ .

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV). It is derived from combinations of their results on  $B^+ \rightarrow D K^+$  and related processes.

$\gamma$

For angle  $\gamma(\phi_3)$  of the CKM unitarity triangle, see the review on "CP Violation" in the Reviews section.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV).

<sup>1</sup> Uses binned Dalitz plot analysis of  $D \rightarrow K_S^0 \pi^+ \pi^-$  and  $K_S^0 K^+ K^-$  from  $B^\pm \rightarrow D K^\pm$  modes. Strong phase measurements from CLEO-c and BES-III of the  $D$  decay over the Dalitz plot are used as input. Value is modulo 180°.

<sup>2</sup> Supersedes AIHARA 12.

<sup>3</sup> AAIJ 21AM presents a combination of existing measurements from LHCb collaboration.  
It includes also charm mixing parameters.

<sup>4</sup> Measured in  $B_s^0 \rightarrow D_s^\pm K^\mp \pi^\pm \pi^\mp$  decays in restricted phase space with  $m(K^+ \pi^+ \pi^-) < 1950$  MeV,  $m(K^+ \pi^-) < 1200$  MeV and  $m(\pi^+ \pi^-) < 1200$  MeV. The value is modulo  $180^\circ$ .

<sup>5</sup> A model-independent coherence factor for the decay  $B_s \rightarrow D_s K \pi \pi$  (in the restricted phase space region) is also reported.

<sup>6</sup> Uses binned analysis of  $D \rightarrow K_S^0 \pi^+ \pi^- \pi^0$  from  $B^\pm \rightarrow D K^\pm$  modes over the phase space. Strong phase measurements from RESMI 18 analysis of CLEO-c data of the  $D$  decay over the phase space binning are used as input.

<sup>7</sup> Uses binned Dalitz plot analysis of  $D \rightarrow K_S^0 \pi^+ \pi^-$  and  $K_S^0 K^+ K^-$  from  $B^\pm \rightarrow D K^\pm$  modes. Strong phase measurements from CLEO-c of the  $D$  decay over the Dalitz plot are used as input.

<sup>8</sup> Measured in  $B_s^0 \rightarrow D_s^\mp K^\pm$  decays, constraining  $-2\beta_s$  by the measurement of  $\phi_s = 0.030 \pm 0.033$  from HFLAV. The value is modulo  $180^\circ$ .

<sup>9</sup> AAIJ 18Z reports the intervals  $(5\text{--}86)^\circ$  or  $(185\text{--}266)^\circ$  at 68% C.L. The extraction uses the time dependent CP violation measurement in  $B^0 \rightarrow D^\mp \pi^\pm$  decays with external input and some theoretical assumptions.

<sup>10</sup> Uses Dalitz plot analysis of  $D \rightarrow K_S^0 \pi^+ \pi^-$  decays coming from  $B^0 \rightarrow D K^*(892)^0$  modes. Measures  $r_{B^0} = 0.39 \pm 0.13$ , and  $\delta_{B^0} = 197^{+24}_{-20}$  degrees.

<sup>11</sup> A combination of measurements from analyses of time-integrated  $B^+ \rightarrow D K^+$ ,  $B^0 \rightarrow D K^*(*)^0$ ,  $B^0 \rightarrow D K^+ \pi^-$ , and  $B^+ \rightarrow D K^+ \pi^+ \pi^-$  tree-level decays. In addition, results from a time-dependent analysis of  $B_s^0 \rightarrow D_s K$  decays are included.

<sup>12</sup> A model-independent binned Dalitz plot analysis of the decays  $B^0 \rightarrow D K^{*0}$ , with  $D \rightarrow K_S^0 \pi^+ \pi^-$  and  $D \rightarrow K_S^0 K^+ K^-$ . The results cannot be combined with the model-dependent analysis of the same dataset reported in AAIJ 16AA.

<sup>13</sup> Angle  $\gamma$  required to satisfy  $0 < \gamma < 180$  degrees.

<sup>14</sup> Obtained by measuring time-dependent CP asymmetry in  $B_s^0 \rightarrow K^+ K^-$  and using a U-spin relation between  $B_s^0 \rightarrow K^+ K^-$  and  $B^0 \rightarrow \pi^+ \pi^-$ .

<sup>15</sup> Results are also presented using additional inputs on  $B^0 \rightarrow \pi^0 \pi^0$  and  $B^+ \rightarrow \pi^+ \pi^0$  decays from other experiments and isospin symmetry assumptions. The dependence of the results on the maximum allowed amount of U-spin breaking up to 50% is also included.

<sup>16</sup> Uses binned Dalitz plot analysis of  $B^+ \rightarrow D K^+$  decays, with  $D \rightarrow K_S^0 \pi^+ \pi^-$  and  $D \rightarrow K_S^0 K^+ K^-$ . Strong phase measurements from CLEO-c (LIBBY 10) of the  $D$  decay over the Dalitz plot are used as input. Solution that satisfies  $0 < \gamma < 180$  is chosen.

<sup>17</sup> AAIJ 14BE uses model-dependent analysis of  $D \rightarrow K_S^0 \pi^+ \pi^-$  amplitudes. The model is the same as in DEL-AMO-SANCHEZ 10F.

<sup>18</sup> Measured in  $B_s^0 \rightarrow D_s^\mp K^\pm$  decays, constraining  $-2\beta_s$  by the measurement of  $\phi_s = 0.01 \pm 0.07 \pm 0.0$  from AAIJ 13AR. The value is modulo  $180^\circ$  at 68% CL.

<sup>19</sup> Presents a confidence region  $55.4^\circ < \gamma < 82.3^\circ$  at 68% CL with best fit value  $72.6^\circ$  and includes both statistical and systematic uncertainties. The corresponding 95% CL is  $40.2^\circ < \gamma < 92.7^\circ$ . The value is determined from combination of measurements using  $D$  meson decaying to  $K^+ K^-$ ,  $\pi^+ \pi^-$ ,  $K^\pm \pi^\mp$ ,  $K_S^0 \pi^+ \pi^-$ ,  $K_S^0 K^+ K^-$ , and  $K^\pm \pi^\mp \pi^\pm \pi^\mp$ . Combines  $B^\pm \rightarrow D K^\pm$  and  $B^\pm \rightarrow D \pi^\pm$ .

<sup>20</sup> Reports combination of published measurements using GGSZ, GLW, and ADS methods. Reports also  $2\sigma$  range of  $41\text{--}102^\circ$  and a  $5.9\sigma$  significance for  $\gamma(B^+ \rightarrow D^{(*)0} K^{(*)+}) \neq 0$  hypothesis.

<sup>21</sup> Reports combined statistical and systematic uncertainties.

- 22 Uses binned Dalitz plot of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays from  $B^+ \rightarrow \bar{D}^0 K^+$ . Measurement of strong phases in  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  Dalitz plot from LIBBY 10 is used as input.
- 23 We combined the systematics in quadrature. The authors report separately the contribution to the systematic uncertainty due to the uncertainty on the bin-averaged strong phase difference between  $D^0$  and  $\bar{D}^0$  amplitudes. Superseded by ABUDINEN 22.
- 24 Uses Dalitz plot analysis of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ ,  $K_S^0 K^+ K^-$  decays from  $B^+ \rightarrow D(*) K^+$ ,  $D K^{*+}$  modes. The corresponding two standard deviation interval for  $\gamma$  is  $39^\circ < \gamma < 98^\circ$ . CP conservation in the combined result is ruled out with a significance of 3.5 standard deviations.
- 25 Reports confidence intervals for the CKM angle  $\gamma$  from the measured values of the GLW parameters using  $B^\pm \rightarrow D K^\pm$  decays with  $D$  mesons decaying to non- $CP(K\pi)$ ,  $CP$ -even ( $K^+ K^-$ ,  $\pi^+ \pi^-$ ), and  $CP$ -odd ( $K_S^0 \pi^0$ ,  $K_S^0 \omega$ ) states.
- 26 Uses Dalitz plot analysis of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays from  $B^+ \rightarrow D(*) K^+$  modes. The corresponding two standard deviation interval for  $\gamma$  is  $54.2^\circ < \gamma < 100.5^\circ$ . CP conservation in the combined result is ruled out with a significance of 3.5 standard deviations.
- 27 Uses Dalitz plot analysis of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays coming from  $B^0 \rightarrow D^0 K^{*0}$  modes. The corresponding 95% CL interval is  $77^\circ < \gamma < 247^\circ$ . A 180 degree ambiguity is implied.
- 28 Uses Dalitz plot analysis of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  and  $\bar{D}^0 \rightarrow K_S^0 K^+ K^-$  decays coming from  $B^\pm \rightarrow D(*) K^{(*)\pm}$  modes. The corresponding two standard deviation interval is  $29^\circ < \gamma < 122^\circ$ .
- 29 Uses a Dalitz plot analysis of the  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays; Combines the  $D K^+$ ,  $D^* K^+$  and  $D K^{*+}$  modes. The corresponding two standard deviations interval for gamma is  $8^\circ < \gamma < 111^\circ$ .
- 30 Uses a Dalitz plot analysis of neutral  $D \rightarrow K_S^0 \pi^+ \pi^-$  decays coming from  $B^\pm \rightarrow D K^\pm$  and  $B^\pm \rightarrow D^{*0} K^\pm$  followed by  $D^{*0} \rightarrow D\pi^0$ ,  $D\gamma$ . The corresponding two standard deviations interval for gamma is  $12^\circ < \gamma < 137^\circ$ . AUBERT,B 05Y also reports the amplitude ratios and the strong phases.
- 31 Uses a Dalitz plot analysis of the 3-body  $D \rightarrow K_S^0 \pi^+ \pi^-$  decays coming from  $B^\pm \rightarrow D K^\pm$  and  $B^\pm \rightarrow D^* K^\pm$  followed by  $D^* \rightarrow D\pi^0$ ; here we use  $D$  to denote that the neutral  $D$  meson produced in the decay is an admixture of  $D^0$  and  $\bar{D}^0$ . The corresponding two standard deviations interval for  $\gamma$  is  $26^\circ < \gamma < 126^\circ$ . POLUEKTOV 04 also reports the amplitude ratios and the strong phases.

### $r_B(B^+ \rightarrow D^0 K^+)$

$r_B$  and  $\delta_B$  are the amplitude ratio and relative strong phase between the amplitudes of  $A(B^+ \rightarrow D^0 K^+)$  and  $A(B^+ \rightarrow \bar{D}^0 K^+)$ ,

$0.564^{+0.216}_{-0.155} \pm 0.093$	<sup>5</sup> POLUEKTOV	06 BELL	$e^+ e^- \rightarrow \gamma(4S)$

<sup>1</sup> Reports combination of published measurements using GGSZ, GLW, and ADS methods.

<sup>2</sup> DEL-AMO-SANCHEZ 10F reports  $r_B \cdot k = 0.149^{+0.066}_{-0.062}$  for  $k = 0.9$ .

<sup>3</sup> Obtained by combining the GLW and ADS methods. The 2-sigma range corresponds to [0.17, 0.43].

<sup>4</sup> Uses Dalitz plot analysis of  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  and  $\bar{D}^0 \rightarrow K_S^0 K^+ K^-$  decays coming from  $B^\pm \rightarrow D^{(*)} K^{(*)\pm}$  modes.

<sup>5</sup> Uses a Dalitz plot analysis of the  $\bar{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays; Combines the  $D K^+$ ,  $D^* K^+$  and  $D K^{*+}$  modes.

### $\delta_B(B^+ \rightarrow D^0 K^{*+})$

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV).

$1.39^{+0.36}_{-0.33} \pm 0.02$	<sup>2</sup> CHOUDHURY 21	BELL	$e^+ e^- \rightarrow \gamma(4S)$
• • • We do not use the following data for averages, fits, limits, etc. • • •			
$0.846^{+0.060}_{-0.054}{}^{+0.016}_{-0.014}$	<sup>1,3</sup> AAIJ	19S LHCb	$p p$ at 7, 8, 13 TeV
$0.745^{+0.090}_{-0.074} \pm 0.036$	<sup>1</sup> AAIJ	14AR LHCb	$p p$ at 7, 8 TeV

<sup>1</sup> The ratio is determined using the relative branching fractions of the decays  $B^+ \rightarrow K^+ \ell^+ \ell^-$  and  $B^+ \rightarrow J/\psi(\rightarrow \ell^+ \ell^-) K^+$ , with  $\ell = e, \mu$ . Measured for the region  $1.1 < q^2 < 6.0 \text{ GeV}^2/c^4$ .

<sup>2</sup> Measurements in other  $q^2$  bins are also reported.

<sup>3</sup> Superseded by AAIJ 22V.

## FORWARD-BACKWARD ASYMMETRIES

The forward-backward assymmetry is defined as  $A_{FB} = [N(q_{FB} > 0) - N(q_{FB} < 0)] / [N(q_{FB} > 0) + N(q_{FB} < 0)]$ , where  $q_{FB} = -q_B \cdot \text{sgn}(\eta_B)$  with  $q_B$  as the  $B$  hadron electric charge,  $\eta_B$  as its pseudorapidity, and  $\text{sgn}(\eta_B)$  as a sign function of  $\eta_B$ .
