

# $Z_{cs}(4000)$

$$I(J^P) = \frac{1}{2}(1^+)$$

## OMMITTED FROM SUMMARY TABLE

Properties incompatible with a  $q\bar{q}$  structure (exotic state). See the review on "Heavy Non- $q\bar{q}$  Mesons."

Seen by AAIJ 21E in  $B^+ \rightarrow Z_{cs}(4000)^+ \phi$  with  $Z_{cs}(4000)^+ \rightarrow J/\psi K^+$  using an amplitude analysis of  $B^+ \rightarrow J/\psi \phi K^+$  with a significance (accounting for systematic uncertainties) of  $15\sigma$ . The  $J^P = 1^+$  assignment is favored with high significance. ABLIKIM 21G also reports a  $J^P = 1^+$   $Z_{cs}$  state in this mass region using  $e^+ e^- \rightarrow K^+ (D_s^- D^{*0} + D_s^{*-} D^0)$  with a significance of  $5.3\sigma$ . The incompatible values for the widths reported by AAIJ 21E and ABLIKIM 21G could either indicate the existence of two separate states or possibly be explained in a coupled channel model (see ORTEGA 21).
