

Heavy Neutral Leptons, Searches for

OMITTED FROM SUMMARY TABLE

We define searches for Heavy Neutral Leptons (HNLs) as searches for Dirac or Majorana fermions with sterile neutrino quantum numbers, that are heavy enough to not disrupt the simplest Big Bang Nucleosynthesis bounds and/or unstable on cosmological timescales: Typically HNLs have mass \sim MeV or higher.

Searches for these particles generically set bounds on the mixing between the HNL and the active neutrinos, as parametrized by the extended 3×4 PMNS matrix elements $U_{\ell X}$ (see the "Neutrino mass, mixing and oscillations" review) where $\ell = e, \mu$ or τ , and we denote the HNL as ν_X . While many measurements may be interpreted to place bounds on various combinations of these matrix elements, we quote below limits only for those cases in which one matrix element is assumed to be much larger than the other two, i.e. $|U_{\ell X}| \gg |U_{\ell' X}|$ for $\ell' \neq \ell$.

Experimental searches make use of various different strategies, including e.g. resonance searches in missing mass decay distributions or specific final states, searches for lepton number violating decays, and trilepton signatures. The resulting bounds on $U_{\ell X}$ are typically dependent on the HNL mass. The quoted limits below are either the best limit near an experimental kinematic threshold, or a characteristic value in the mass range of the experimental sensitivity.

¹ Search for $\nu_X \rightarrow \mu^+ \mu^- \nu$.

² Reanalysis of CHARM results (cf. ORLOFF 02) to include searches for $\nu_X \rightarrow \nu \ell^+ \ell^-$ decays, and including the production of HNLs from τ decays.

³ $D_s \rightarrow \tau^+ \nu_X$, with ν_X decay via $U_{\tau X}$.

⁵ Search for prompt ν_X decay signatures.

⁶ Search for displaced ν_X decay signatures. Kinematical suppression of $\nu_X \rightarrow \tau X$ at lower masses leads to rapid loosening of the $|U_{\tau X}|$ bound compared to that for $|U_{eX}|$ and $|U_{\mu X}|$.

⁷ TUMASYAN 22H sets limits on an approximately mass-degenerate vector-like lepton SU(2) doublet coupling to the τ . Some of the reported signal region distributions might be used to set limits for heavy neutral leptons coupled to the τ . The data correspond to an integrated luminosity of 138 fb^{-1} .
