

***n***

$$I(J^P) = \frac{1}{2}(\frac{1}{2}^+) \text{ Status: } ***$$

We have omitted some results that have been superseded by later experiments. See our earlier editions.

Anyone interested in the neutron should look at these two review articles: D. Dubbers and M.G. Schmidt, "The neutron and its role in cosmology and particle physics," *Reviews of Modern Physics* **83** 1111 (2011); and F.E. Wietfeldt and G.L. Greene, "The neutron lifetime," *Reviews of Modern Physics* **83** 1173 (2011).

### ***n* MASS (atomic mass units u)**

The mass is known much more precisely in u (atomic mass units) than in MeV. See the next data block.

VALUE (u)	DOCUMENT ID	TECN	COMMENT
<b>1.00866491595±0.00000000049</b>	TIESINGA	21	RVUE 2018 CODATA value

<sup>1</sup> The 2018 CODATA mass difference in u is  $m_n - m_p = 1.388\ 449\ 33(49) \times 10^{-3}$  u.

<sup>2</sup> The 2014 CODATA mass difference in u is  $m_n - m_p = 1.388\ 449\ 00(51) \times 10^{-3}$  u.

<sup>3</sup> The 2010 CODATA mass difference in u is  $m_n - m_p = 1.388\ 449\ 19(45) \times 10^{-3}$  u.

<sup>4</sup> Calculated by us from the MOHR 08 ratio  $m_n/m_p = 1.00137841918(46)$ . In u,  $m_n - m_p = 1.38844920(46) \times 10^{-3}$  u.

<sup>5</sup> Calculated by us from the MOHR 05 ratio  $m_n/m_p = 1.00137841870 \pm 0.00000000058$ .

In u,  $m_n - m_p = (1.3884487 \pm 0.0000006) \times 10^{-3}$  u.

<sup>6</sup> Calculated by us from the MOHR 99 ratio  $m_n/m_p = 1.00137841887 \pm 0.00000000058$ .

In u,  $m_n - m_p = (1.3884489 \pm 0.0000006) \times 10^{-3}$  u.

<sup>7</sup> Calculated by us from the COHEN 87 ratio  $m_n/m_p = 1.001378404 \pm 0.000000009$ . In u,  $m_n - m_p = 0.001388434 \pm 0.000000009$  u.

## $n$ MEAN LIFE

Limits on lifetimes for *bound* neutrons are given in the section “p PARTIAL MEAN LIVES.”

We average eight of the best nine measurements, those made with ultra-cold neutrons (UCN's). If we include the one in-beam measurement with a comparable error (YUE 13), we get  $878.6 \pm 0.6$  s, where the scale factor is now 2.2.

For a recent discussion of the long-standing disagreement between in-beam and UCN results, see CZARNECKI 18 (Physical Review Letters **120** 202002 (2018)). For a full review of all matters concerning the neutron lifetime until about 2010, see WIETFELDT 11, F.E. Wietfeldt and G.L. Greene, "The neutron lifetime," Reviews of Modern Physics **83** 1173 (2011).

<sup>1</sup> PATTIE 18 uses a new technique, with a semi-toroidal magneto-gravitational asymmetric trap and a novel in situ *n*-detector.

<sup>2</sup> ARZUMANOV 15 is a reanalysis of their 2008–2010 dataset, with improved systematic corrections of of ARZUMANOV 00 and ARZUMANOV 12.

<sup>3</sup> STEYERL 12 is a detailed reanalysis of neutron storage loss corrections to the raw data of MAMPE 89, and it replaces that value.

<sup>4</sup> WILSON 21 extract the value from the flux of  $n$  escaping the moon using data from the Lunar Prospector Neutron Spectrometer.

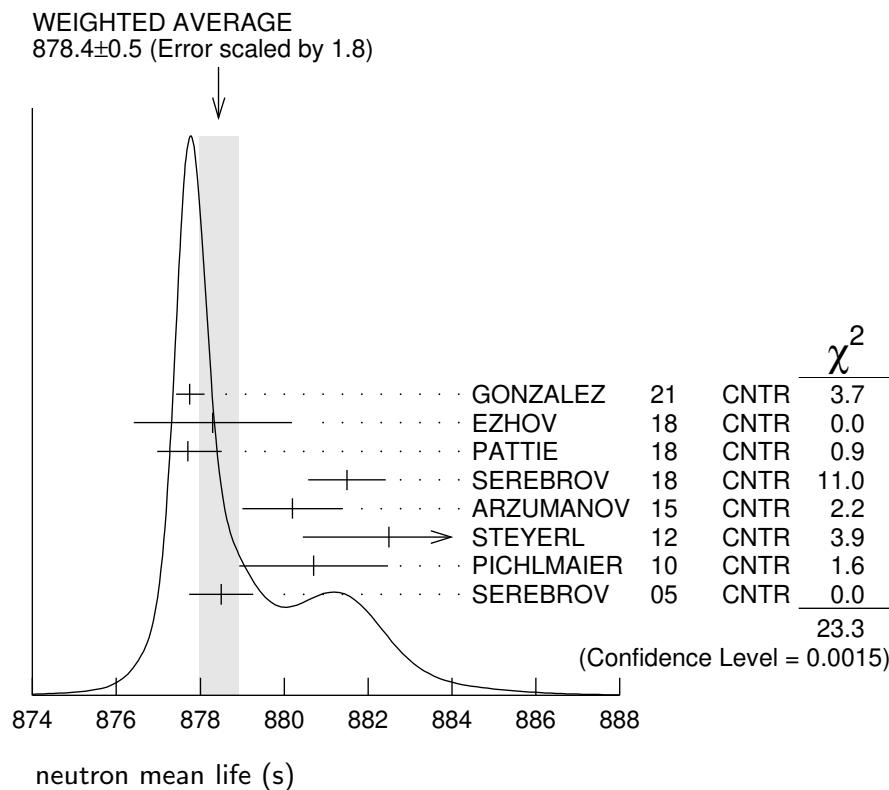

<sup>5</sup> YUE 13 differs from NICO 05 in that a different and better method was used to measure the neutron density in the fiducial volume. This shifted the lifetime by +1.4 seconds and reduced the previously largest source of systematic uncertainty by a factor of five.

<sup>6</sup> ARZUMANOV 12 reanalyzes its systematic corrections in ARZUMANOV 00 and obtains this corrected value.

<sup>7</sup> IGNATOVICH 95 calls into question some of the corrections and averaging procedures used by MAMPE 93. The response, BONDARENKO 96, denies the validity of the criticisms.

<sup>8</sup> The NESVIZHEVSKII 92 measurement has been withdrawn by A. Serebrov.

<sup>9</sup> The BYRNE 80 measurement has been withdrawn (J. Byrne, private communication, 1990).

## $n$ MAGNETIC MOMENT

See the “Quark Model” review.

VALUE ( $\mu_N$ )	DOCUMENT ID	TECN	COMMENT
<b>-1.91304273±0.00000045</b>	TIESINGA 21	RVUE	2018 CODATA value
<b>• • • We do not use the following data for averages, fits, limits, etc. • • •</b>

< 16	90	ALTAREV	79	MRS $d = (4.0 \pm 7.5) \times 10^{-25}$

<sup>1</sup> ABEL 20 reports  $d = (0.0 \pm 1.1 \pm 0.2) \times 10^{-26}$  e cm value corresponding to the listed limit.

<sup>2</sup> SAHOO 17 develops theory to calculate this limit from the measured limit by GRANER 16 of the <sup>199</sup>Hg atom EDM.

<sup>3</sup> PENDLEBURY 15 reports  $d = (-0.21 \pm 1.82) \times 10^{-26}$  e cm value corresponding to the listed limit.

<sup>4</sup> Serebrov 14 includes the data of ALTAREV 96.

<sup>5</sup> LAMOREAUX 07 faults BAKER 06 for not including in the estimate of systematic error an effect due to the Earth's rotation. BAKER 07 replies (1) that the effect was included implicitly in the analysis and (2) that further analysis confirms that the BAKER 06 limit is correct as is. See also SILENKO 07.

<sup>6</sup> This HARRIS 99 result includes the result of SMITH 90. However, the averaging of the results of these two experiments has been criticized by LAMOREAUX 00.

## *n* MEAN-SQUARE CHARGE RADIUS

The mean-square charge radius of the neutron,  $\langle r_n^2 \rangle$ , is related to the neutron-electron scattering length  $b_{ne}$  by  $\langle r_n^2 \rangle = 3(m_e a_0 / m_n) b_{ne}$ , where  $m_e$  and  $m_n$  are the masses of the electron and neutron, and  $a_0$  is

the Bohr radius. Numerically,  $\langle r_n^2 \rangle = 86.34 b_{ne}$ , if we use  $a_0$  for a nucleus with infinite mass.

## LIMIT ON $n\bar{n}$ OSCILLATIONS

### Mean Time for $n\bar{n}$ Transition

A test of  $\Delta B=2$  baryon number nonconservation. MOHAPATRA 80 and MOHAPATRA 89 discuss the theoretical motivations for looking for  $n\bar{n}$  oscillations. DOVER 83 and DOVER 85 give phenomenological analyses. The best limits come from looking for the decay of neutrons bound in nuclei. However, these analyses require model-dependent corrections for nuclear effects. See KABIR 83, DOVER 89, ALBERICO 91, and GAL 00 for discussions. Direct searches for  $n \rightarrow \bar{n}$  transitions using reactor neutrons are cleaner but give somewhat poorer limits. We include limits for both free and bound neutrons in the Summary Table. See MOHAPATRA 09 and PHILLIPS 16 for recent reviews.

<sup>2</sup> The AHARMIM 17 value is an unbounded limit (it does not assume a positive lifetime).

The bounded limit is  $1.23 \times 10^8$  sec.

---

## LIMIT ON $nn'$ OSCILLATIONS

Lee and Yang (LEE 56) proposed the existence of mirror world in an attempt to restore global parity symmetry. A possible candidate for dark matter. Limits depend on assumptions about fields  $B$  and  $B'$ . See the papers for details. See BEREZHIANI 18 for a recent discussion.

$<1 \times 10^{-4}$	90	<sup>2</sup> SUN	18	SPEC Ultracold $n$ , polarized

<sup>1</sup>KLOPF 19 value is for baryon number violating decay of neutron to electrons plus an invisible state,  $\chi$ . The limit is valid for  $\text{KE}(e^+ e^-)$  range between 32 keV and 664 keV, strengthening to few  $\times 10^{-4}$  above approximately 100 keV.

<sup>2</sup>SUN 18 value is for baryon number violating decay of neutron to electrons plus an invisible state,  $\chi$ . The limit is valid for  $644 \text{ keV} > \text{KE}(e^+ e^-) > 100 \text{ keV}$ . Assuming this decay  $\chi e e$  is the only allowed  $\chi$  decay channel, a 0.01 BR is ruled out for  $644 \text{ keV} > E(e^+ e^-) > 100 \text{ keV}$  at over  $5\sigma$ .

+22 ± 30	EROZOLIM...	78	CNTR Cold $n$ , polarized
-27 ± 50	<sup>1</sup> EROZOLIM...	74	CNTR Cold $n$ , polarized
-11 ± 17	STEINBERG	74	CNTR Cold $n$ , polarized

<sup>1</sup> EROZOLIMSKII 78 says asymmetric proton losses and nonuniform beam polarization may give a systematic error up to  $30 \times 10^{-4}$ , thus increasing the EROZOLIMSKII 74 error to  $50 \times 10^{-4}$ . STEINBERG 74 and STEINBERG 76 estimate these systematic errors to be insignificant in their experiment.

## TRIPLE CORRELATION COEFFICIENT $R$

Another test of time-reversal invariance.  $R$  measures the polarization of the electron in the direction perpendicular to the plane defined by the neutron spin and the electron momentum.  $R = 0$  for  $T$  invariance.
