

$$\Sigma(1775) D_{15}$$

$$I(J^P) = 1(\frac{5}{2}^-) \text{ Status: } ****$$

Discovered by GALTIERI 63, this resonance plays the same role as cornerstone for isospin-1 analyses in this region as the  $\Lambda(1820)$  does in the isospin-0 channel.

For most results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** (1982).

$\Sigma(1775)$  DECAY MODES

| Mode                        | Fraction ( $\Gamma_i/\Gamma$ ) |
|-----------------------------|--------------------------------|
| $\Gamma_1$ $N \overline{K}$ | 37–43%                         |
| $\Gamma_2$ $\Lambda \pi$    | 14–20%                         |
| $\Gamma_3$ $\Sigma \pi$     | 2–5%                           |

|            |                                  |        |
|------------|----------------------------------|--------|
| $\Gamma_4$ | $\Sigma(1385)\pi$                | 8–12%  |
| $\Gamma_5$ | $\Sigma(1385)\pi, D\text{-wave}$ |        |
| $\Gamma_6$ | $\Lambda(1520)\pi$               | 17–23% |
| $\Gamma_7$ | $\Sigma\pi\pi$                   |        |

The above branching fractions are our estimates, not fits or averages.

### CONSTRAINED FIT INFORMATION

An overall fit to 8 branching ratios uses 16 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 63.9$  for 12 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

|       |       |       |       |       |
|-------|-------|-------|-------|-------|
| $x_2$ | −30   |       |       |       |
| $x_3$ | −17   | −21   |       |       |
| $x_4$ | −37   | −49   | −14   |       |
| $x_6$ | −81   | 6     | 8     | 16    |
|       | $x_1$ | $x_2$ | $x_3$ | $x_4$ |

### $\Sigma(1775)$ BRANCHING RATIOS

See “Sign conventions for resonance couplings” in the Note on  $\Lambda$  and  $\Sigma$  Resonances. Also, the errors quoted do not include uncertainties due to the parametrization used in the partial-wave analyses and are thus too small.

| $\Gamma(N\bar{K})/\Gamma_{\text{total}}$                                      |                                     |      |                                      | $\Gamma_1/\Gamma$ |

- <sup>1</sup> The two MARTIN 77 values are from a T-matrix pole and from a Breit-Wigner fit.
- <sup>2</sup> This rate combines *P*-wave- and *F*-wave decays. The CAMERON 77 results for the separate *P*-wave- and *F*-wave decays are  $-0.303 \pm 0.010$  and  $-0.037 \pm 0.014$ . The published signs have been changed here to be in accord with the baryon-first convention.
- <sup>3</sup> The CAMERON 78 upper limit on *G*-wave decay is 0.03.
- <sup>4</sup> For about 3/4 of this, the  $\Sigma\pi$  system has  $I = 0$  and is almost entirely  $\Lambda(1520)$ . For the rest, the  $\Sigma\pi$  has  $I = 1$ , which is about what is expected from the known  $\Sigma(1775) \rightarrow \Sigma(1385)\pi$  rate, as seen in  $\Lambda\pi\pi$ .
