## **c-QUARK MASS**

The *c*-quark mass is estimated from charmonium and *D* masses. It corresponds to the “running” mass  $m_c$  ( $\mu = m_c$ ) in the  $\overline{\text{MS}}$  scheme. We have converted masses in other schemes to the  $\overline{\text{MS}}$  scheme using two-loop QCD perturbation theory with  $\alpha_s(\mu=m_c) = 0.39$ . The range 1.0–1.4 GeV for the  $\overline{\text{MS}}$  mass corresponds to 1.47–1.83 GeV for the pole mass (see the “Note on Quark Masses”).

1.79 ± 0.38	<sup>8</sup> VILAIN 99	THEO	$\overline{\text{MS}}$ scheme

<sup>1</sup> BECIVERIC 02 uses Monte-Carlo calculations of lattice Ward identities and the  $D_s$  mass.  
<sup>2</sup> EIDEMULLER 01 result is QCD sum rule analysis of charmonium using NRQCD at next-to-next-to-leading order.  
<sup>3</sup> KUHN 01 uses an analysis of the  $e^+ e^-$  total cross section to hadrons.  
<sup>4</sup> MARTIN 01 obtain a pole mass of 1.33–1.4 GeV from an analysis of  $R$ , the rate for  $e^+ e^- \rightarrow$  hadrons. We have converted this to the  $\overline{\text{MS}}$  scheme using the two-loop formula.  
<sup>5</sup> NARISON 01B uses pseudoscalar sum rules in the *B* and *D* meson channels.  
<sup>6</sup> PENARROCHA 01 result is from an analysis of the BES-II  $e^+ e^-$  data using finite energy sum rules.  
<sup>7</sup> Study of opposite sign dimuon events.  
<sup>8</sup> VILAIN 99 obtain the charm quark mass from an analysis of charm production in neutrino scattering.
