

$\Phi(1860)$

$$I(J^P) = \frac{3}{2}(?^?)$$

OMITTED FROM SUMMARY TABLE

ALT 04 with 1640 Ξ^- candidates in pp reaction at $\sqrt{s} = 17.2$ GeV sees peaks in the $\Xi^- \pi^-$ and $\Xi^- \pi^+$ mass spectra. The minimum quark content would be $ssdd\bar{u}$.

However:

- ADAMOVIČH 04 with 676k Ξ^- candidates in Σ^- -nucleus reactions at a mean Σ^- momentum of 340 GeV/c finds no evidence for the peak.
- Neither does SCHAEEL 04 in a search in 3.5M Z decays.
- FISCHER 04 claims the ALT 04 result is inconsistent with the 40-year accumulation of $\Xi\pi$ spectra, and also with the absence of any hint of the $\Theta(1540)^+$ in their experiment.
- ABT 04A finds no evidence in p -nucleus reactions at mid-rapidity and $\sqrt{s}=41.6$ GeV.
- AIRAPETIAN 05 finds no evidence in quasi-real photoproduction of $\Xi^- \pi^\pm$ with 27.6-GeV e^+ incident on deuterium.
- CHEKANOV 05 finds no evidence in deep-inelastic ep scattering at c.m. energies of 300 and 318 GeV.
- AGEEV 05 finds no evidence in quasi-real photoproduction with 160-GeV muons on an LiD target.
- AUBERT,B 05D in $e^+e^- \rightarrow \Xi^- \pi^\pm X$ (and charge conjugates) finds 24,000 $\Xi(1530)^0$ and 8,000 $\Xi_c(2470)^0$ but no $\Phi(1860)^0$ or $\Phi(1860)^{--}$.
- CHRISTIAN 05 finds no evidence in $pp \rightarrow p_{\text{fast}} X$ at 800-GeV incident momentum.

¹ALT 04 estimates a peak of 38 $\Xi^- \pi^-$ events above a background of 43 events and claims a significance of 4.2 standard deviations. Combining $\Xi^- \pi^-$, $\Xi^- \pi^+$, $\Xi^+ \pi^+$, and $\Xi^+ \pi^-$ events, ALT 04 estimates a peak of 69 over a background of 75, for 5.8σ . However, when the number of bins searched in is taken into account, the significance falls to 4.2σ .
