## QUARKS

The $u$-, $d$-, and $s$-quark masses are estimates of so-called "currentquark masses," in a mass-independent subtraction scheme such as $\overline{\mathrm{MS}}$ at a scale $\mu \approx 2 \mathrm{GeV}$. The $c$ - and $b$-quark masses are the "running" masses in the MS scheme. For the $b$-quark we also quote the $1 S$ mass. These can be different from the heavy quark masses obtained in potential models.

All searches since 1977 have had negative results.

## NOTES

[a] A discussion of the definition of the top quark mass in these measurements can be found in the review "The Top Quark."
[b] Based on published top mass measurements using data from Tevatron Run-I and Run-II and LHC at $\sqrt{s}=7 \mathrm{TeV}$. Including the most recent unpublished results from Tevatron Run-II, the Tevatron Electroweak Working Group reports a top mass of $173.2 \pm 0.9 \mathrm{GeV}$. See the note "The Top Quark' in the Quark Particle Listings of this Review.
[ $c$ ] $\ell$ means $e$ or $\mu$ decay mode, not the sum over them.
[d] Assumes lepton universality and $W$-decay acceptance.
[e] This limit is for $\Gamma(t \rightarrow Z q) / \Gamma(t \rightarrow W b)$.
