## $K^*(892)$ MASSES AND MASS DIFFERENCES

Unrealistically small errors have been reported by some experiments. We use simple “realistic” tests for the minimum errors on the determination of a mass and width from a sample of  $N$  events:

$$\delta_{\min}(m) = \frac{\Gamma}{\sqrt{N}}, \quad \delta_{\min}(\Gamma) = 4 \frac{\Gamma}{\sqrt{N}}. \quad (1)$$

We consistently increase unrealistic errors before averaging. For a detailed discussion, see the 1971 edition of this Note.

- <sup>6</sup> Width errors enlarged by us to  $4 \times \Gamma/\sqrt{N}$ ; see note.
- <sup>7</sup> Number of events in peak reevaluated by us.
- <sup>8</sup> From a Dalitz plot analysis in an isobar model with charged and neutral  $K^*$  (892) masses and widths floating.
- <sup>9</sup> This value comes from a fit with  $\chi^2$  of 178/117.
- <sup>10</sup> Systematic uncertainties not estimated.

**CONSTRAINED FIT INFORMATION**

An overall fit to the total width and a partial width uses 14 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 9.8$  for 12 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.
