

**$\Lambda(2000)$**  $I(J^P) = 0(?^?)$  Status: \*

## OMITTED FROM SUMMARY TABLE

ZHANG 13A claims a  $J^P = 1/2^-$  state.

We list here all the ambiguous resonance possibilities with a mass around 2 GeV. The proposed quantum numbers are  $D_3$  (BARBARO-GALTIERI 70 in  $\Sigma\pi$ ),  $D_3+F_5$ ,  $P_3+D_5$ , or  $P_1+D_3$  (BRANDSTETTER 72 in  $\Lambda\omega$ ), and  $S_1$  (CAMERON 78B in  $N\bar{K}^*$ ). The first two of the above analyses should now be considered obsolete. See also NAKKASYAN 75.

### $\Lambda(2000)$ FOOTNOTES

<sup>1</sup> The parameters quoted here are ranges from the three best fits; the lower state probably has  $J \leq 3/2$ , and the higher one probably has  $J \leq 5/2$ .

<sup>2</sup> The published sign has been changed to be in accord with the baryon-first convention.
