New Heavy Bosons (W', Z', leptoquarks, etc.), Searches for

We list here various limits on charged and neutral heavy vector bosons (other than W's and Z's), heavy scalar bosons (other than Higgs bosons), vector or scalar leptoquarks, and axigluons. The latest unpublished results are described in "W' Searches" and "Z' Searches" reviews. For recent searches on scalar bosons which could be identified as Higgs bosons, see the listings in the Higgs boson section.

MASS LIMITS for W' (Heavy Charged Vector Boson Other Than W) in Hadron Collider Experiments

Couplings of W' to quarks and leptons are taken to be identical with those of W. The following limits are obtained from $p\overline{p}$ or $pp \rightarrow W'X$ with W' decaying to the mode

indicated in the comments. New decay channels (e.g., $W' ightarrow WZ$) are assumed to
be suppressed. The most recent preliminary results can be found in the " W' -boson

W_R (Right-Handed W Boson) MASS LIMITS

Assuming a light right-handed neutrino, except for BEALL 82, LANGACKER 89B, and COLANGELO 91. $g_R = g_L$ assumed. [Limits in the section MASS LIMITS for W' below are also valid for W_R if $m_{\nu_R} \ll m_{W_R}$.] Some limits assume manifest left-right symmetry, *i.e.*, the equality of left- and right Cabibbo-Kobayashi-Maskawa matrices. For a comprehensive review, see LANGACKER 89B. Limits on the W_L-W_R mixing angle ζ are found in the next section. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

Limits for Z_n

 Z_η is the extra neutral boson in E_6 models, corresponding to $Q_\eta = \sqrt{3/8} \; Q_\chi$ – $\sqrt{5/8}~ {\it Q}_{\psi}.~ {\it g}_{\eta}=e/{
m cos} heta_W$ is assumed unless otherwise stated. We list limits with the assumption $\rho = 1$ but with no further constraints on the Higgs sector. Values in parentheses assume stronger constraint on the Higgs sector motivated by superstring models. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

Indirect Constraints on Kaluza-Klein Gauge Bosons

Bounds on a Kaluza-Klein excitation of the Z boson or photon in d=1 extra dimension. These bounds can also be interpreted as a lower bound on 1/R, the size of the extra dimension. Unless otherwise stated, bounds assume all fermions live on a single brane and all gauge fields occupy the 4+d-dimensional bulk. See also the section on "Extra Dimensions" in the "Searches" Listings in this *Review*.

¹ MUECK 02 limit is 2σ and is from global electroweak fit ignoring correlations among observables. Higgs is assumed to be confined on the brane and its mass is fixed. For scenarios of bulk Higgs, of brane-SU(2)_L, bulk-U(1)_Y, and of bulk-SU(2)_L, brane-U(1)_Y, the corresponding limits are > 4.6 TeV, > 4.3 TeV and > 3.0 TeV, respectively.

²Bound is derived from limits on $e\nu q q'$ contact interaction, using data from HERA and the Tevatron.

³Bound holds only if first two generations of quarks lives on separate branes. If quark mixing is not complex, then bound lowers to 400 TeV from Δm_K .

⁴ See Figs. 1 and 2 of DELGADO 00 for several model variations. Special boundary conditions can be found which permit KK states down to 950 GeV and that agree with the measurement of Q_W (Cs). Quoted bound assumes all Higgs bosons confined to brane; placing one Higgs doublet in the bulk lowers bound to 2.3 TeV.

⁵ Bound is derived from global electroweak analysis assuming the Higgs field is trapped on the matter brane. If the Higgs propagates in the bulk, the bound increases to 3.8 TeV.

- 6 Bound is derived from global electroweak analysis but considering only presence of the _KK W bosons.
- ⁷ Global electroweak analysis used to obtain bound independent of position of Higgs on brane or in bulk.
- ⁸ Bounds from effect of KK states on G_F , α , M_W , and M_Z . Hard cutoff at string scale determined using gauge coupling unification. Limits for d=2,3,4 rise to 3.5, 5.7, and 7.8 TeV.
- ⁹ Bound obtained for Higgs confined to the matter brane with m_H =500 GeV. For Higgs in the bulk, the bound increases to 3.5 TeV.

- $^{24}\,{\rm CUYPERS}$ 91 compare α_s measured in \varUpsilon decay and that from R at PEP/PETRA energies.
- ²⁵ ABE 90H assumes $\Gamma(g_A) = N\alpha_s m_{g_A}/6$ with N = 5 ($\Gamma(g_A) = 0.09 m_{g_A}$). For N = 10, the excluded region is reduced to 120–150 GeV.
- ²⁶ ROBINETT 89 result demands partial-wave unitarity of J = 0 $t\bar{t} \rightarrow t\bar{t}$ scattering amplitude and derives a limit $m_{g_A} > 0.5 m_t$. Assumes $m_t > 56$ GeV.
- ²⁷ ALBAJAR 88B result is from the nonobservation of a peak in two-jet invariant mass distribution. $\Gamma(g_A) < 0.4 m_{g_A}$ assumed. See also BAGGER 88.
- ²⁸ CUYPERS 88 requires $\Gamma(\Upsilon \rightarrow gg_A) < \Gamma(\Upsilon \rightarrow ggg)$. A similar result is obtained by DONCHESKI 88.
- ²⁹ DONCHESKI 88B requires $\Gamma(\Upsilon \to g q \overline{q})/\Gamma(\Upsilon \to g g g) < 0.25$, where the former decay proceeds via axigluon exchange. A more conservative estimate of < 0.5 leads to $m_{g_A} > 21$ GeV.

- ² KHACHATRYAN 15AV search for pair productions of neutral color-octet weak-triplet scalar particles (Θ^0), decaying to $b\overline{b}$, Zg or γg , in pp collisions at $\sqrt{s} = 8$ TeV. The Θ^0 particle is often predicted in coloron (G', color-octet gauge boson) models and appear in the pp collisions through $G' \rightarrow \Theta^0 \Theta^0$ decays. Assuming $B(\Theta^0 \rightarrow b\overline{b}) = 0.5$, they give limits $m_{\Theta^0} > 623$ GeV (426 GeV) for $m_{G'} = 2.3$ m_{Θ^0} ($m_{G'} = 5$ m_{Θ^0}).

¹ODAKA 89 looked for a narrow or wide scalar resonance in $e^+e^- \rightarrow$ hadrons at E_{cm} 2 55.0–60.8 GeV. 2 DERRICK 86 found no deviation from the Standard Model Bhabha scattering at $E_{\rm cm}=$

29 GeV and set limits on the possible scalar boson e^+e^- coupling. See their figure 4 for excluded region in the $\Gamma(X^0
ightarrow e^+e^-)$ - $m_{\chi 0}$ plane. Electronic chiral invariance requires a parity doublet of X^0 , in which case the limit applies for $\Gamma(X^0
ightarrow e^+e^-) =$ 3 MeV.

³ADEVA 85 first limit is from 2γ , $\mu^+\mu^-$, hadrons assuming X^0 is a scalar. Second limit is from e^+e^- channel. $E_{cm} = 40-47$ GeV. Supersedes ADEVA 84.

⁴ BERGER 85B looked for effect of spin-0 boson exchange in $e^+e^-
ightarrow e^+e^-$ and $\mu^+\mu^$ at $E_{\rm cm}=$ 34.7 GeV. See Fig. 5 for excluded region in the $m_{\chi^0}-\Gamma(X^0)$ plane.

 5 ADEVA 84 and BEHREND 84C have $E_{
m cm}=$ 39.8–45.5 GeV. MARK-J searched X^0 in $e^+e^-
ightarrow$ hadrons, 2 γ , $\mu^+\mu^-$, e^+e^- and CELLO in the same channels plus au pair. No narrow or broad X^0 is found in the energy range. They also searched for the effect of X^0 with $m_X > E_{\rm cm}$. The second limits are from Bhabha data and for spin-0 singlet. The same limits apply for $\Gamma(X^0 \rightarrow e^+e^-) = 2$ MeV if X^0 is a spin-0 doublet. The second limit of BEHREND 84C was read off from their figure 2. The original papers also list limits in other channels.

Search for X^0 Resonance in e^+e^- Collisions The limit is for $\Gamma(X^0 \rightarrow e^+e^-) \cdot B(X^0 \rightarrow f)$, where f is the specified final state. Spin 0 is assumed for X^0 .
