Magnetic Monopole Searches

The most sensitive experiments obtain negative results.

Best cosmic-ray supermassive monopole flux limit:

$$<~1.4\times 10^{-16}~{\rm cm}^{-2}{\rm sr}^{-1}{\rm s}^{-1}~~{\rm for}~1.1\times 10^{-4}<\beta<1$$

Supersymmetric Particle Searches

All supersymmetric mass bounds here are model dependent.

The limits assume:

1) $\widetilde{\chi}_1^0$ is the lightest supersymmetric particle; 2) *R*-parity is conserved, unless stated otherwise;

See the Particle Listings for a Note giving details of supersymmetry.

Technicolor

The limits for technicolor (and top-color) particles are quite varied depending on assumptions. See the Technicolor section of the full *Review* (the data listings).

Scale Limits Λ for Contact Interactions (the lowest dimensional interactions with four fermions)

If the Lagrangian has the form

$$\pm \; \tfrac{g^2}{2 \Lambda^2} \; \overline{\psi}_{\it L} \gamma_{\mu} \psi_{\it L} \overline{\psi}_{\it L} \gamma^{\mu} \psi_{\it L}$$

(with $g^2/4\pi$ set equal to 1), then we define $\Lambda \equiv \Lambda_{LL}^{\pm}$. For the full definitions and for other forms, see the Note in the Listings on Searches for Quark and Lepton Compositeness in the full *Review* and the original literature.

Excited Leptons

The limits from $\ell^{*+}\ell^{*-}$ do not depend on λ (where λ is the $\ell\ell^{*}$ transition coupling). The λ -dependent limits assume chiral coupling.
