## NOTES

- [a] Forbidden by angular momentum conservation.
- [b] C parity forbids this to occur as a single-photon process.
- [c] See the Particle Listings for the (complicated) definition of this quantity.
- [d] Time-reversal invariance requires this to be  $0^\circ$  or  $180^\circ$ .
- [e] This coefficient is zero if time invariance is not violated.
- [f] Allowed by higher-order electroweak interactions.
- [g] Violates *CP* in leading order. Test of direct *CP* violation since the indirect *CP*-violating and *CP*-conserving contributions are expected to be suppressed.
- [h] In the 2010 *Review*, the values for these quantities were given using a measure of the asymmetry that was inconsistent with the usual definition.
- [i]  $\text{Re}(\epsilon'/\epsilon) = \epsilon'/\epsilon$  to a very good approximation provided the phases satisfy *CPT* invariance.
- [j] This mode includes gammas from inner bremsstrahlung but not the direct emission mode  $K_L^0 \rightarrow \pi^+ \pi^- \gamma$ (DE).
- [k] Neglecting photon channels. See, e.g., A. Pais and S.B. Treiman, Phys. Rev. **D12**, 2744 (1975).
- [l] Derived from measured values of  $\phi_{+-}$ ,  $\phi_{00}$ ,  $|\eta|$ ,  $|m_{K_L^0} - m_{K_S^0}|$ , and  $\tau_{K_S^0}$ , as described in the introduction to "Tests of Conservation Laws."
- [n] The  $|m_p - m_{\bar{p}}|/m_p$  and  $|q_p + q_{\bar{p}}|/e$  are not independent, and both use the more precise measurement of  $|q_{\bar{p}}/m_{\bar{p}}|/(q_p/m_p)$ .
- [o] The value is for the sum of the charge states or particle/antiparticle states indicated.
- [p] A test of additive vs. multiplicative lepton family number conservation.
- [q] Derived from an analysis of neutrino-oscillation experiments.
- [r] The first limit is for  $p \rightarrow$  anything or "disappearance" modes of a bound proton. The second entry, a rough range of limits, assumes the dominant decay modes are among those investigated. For antiprotons the best limit, inferred from the observation of cosmic ray  $\bar{p}$ 's is  $\tau_{\bar{p}} > 10^7$  yr, the cosmic-ray storage time, but this limit depends on a number of assumptions. The best direct observation of stored antiprotons gives  $\tau_{\bar{p}}/B(\bar{p} \rightarrow e^- \gamma) > 7 \times 10^5$  yr.
- [s] There is some controversy about whether nuclear physics and model dependence complicate the analysis for bound neutrons (from which the best limit comes). The first limit here is from reactor experiments with free neutrons.
- [t] This is the best limit for the mode  $e^- \rightarrow \nu \gamma$ .

- [u] The limit is from neutrality-of-matter experiments; it assumes  $q_n = q_p + q_e$ . See also the charge of the neutron.
- [v] See the  $K_S^0$  Particle Listings for the energy limits used in this measurement.
- [x] See the  $K_L^0$  Particle Listings for the energy limits used in this measurement.
- [y] An  $\ell$  indicates an  $e$  or a  $\mu$  mode, not a sum over these modes.
- [z] Here  $S$  and  $P$  are the hypothetical scalar and pseudoscalar particles with masses of  $2.5 \text{ GeV}/c^2$  and  $214.3 \text{ MeV}/c^2$ , respectively.
- [aa] This limit is for  $\Gamma(t \rightarrow Z q)/\Gamma(t \rightarrow W b)$ .
