¹ AAD 23AV based on 139 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Pair production of vector-like b' is searched for in the mode $\ell^{\pm}\ell^{\mp} + \geq 2j$ ($\geq 1b$ -tagged) + $\not\!\!E_T$ or with 3ℓ . The data are consistent with the SM background predictions and limits are obtained for different branching ratios.

² TUMASYAN 23V based on 138 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Pair production of vector-like b' is seached for in the single-lepton, same-sign charge dilepton and multi-lepton channels. The data are consistent with the SM background predictions and limits are obtained for different branching ratios.

- ³SIRUNYAN 20BI based on 137 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Pair production of vector-like b' is seached for with each b' decaying into Zb or hb. Analysis focuses on final states consisting of jets from six quarks. Mass limits are obtained for a variety of branching ratios of b' decays.
- ⁴ AABOUD 18CE based on 36.1 fb⁻¹ of proton-proton data taken at $\sqrt{s} = 13$ TeV. Events including a same-sign lepton pair are used. The limit is for a singlet model, assuming the branching ratios of b' into Zb, Wt and Hb as predicted by the model.
- ⁵ AABOUD 18CL, AABOUD 18CP based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like b' using all-hadronic final state. The analysis is particularly powerful for the $b' \rightarrow hb$ mode. Assuming the pure decay only in this mode sets a limit $m_{b'} > 1010$ GeV.
- ⁶AABOUD 18CP based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Pair and single production of vector-like b' are seached for with at least one b' decaying into Zb. In the case of $B(b' \rightarrow Zb) = 1$, the limit is $m_{b'} > 1220$ GeV.

- ⁸ The limit is for the doublet model, assuming that the branching ratios into Wt, Zb, hb add up to one.
- ⁹AABOUD 18CR based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. A combination of searches for the pair-produced vector-like b' in various decay channels ($b' \rightarrow Wt$, Zb, hb). Also a model-independent limit is obtained as $m_{b'} > 1.03$ TeV, assuming that the branching ratios into Zb, Wt, and hb add up to one.
- ¹⁰ The limit is for the singlet b'.
- ¹¹ The limit is for b' in a weak isospin doublet (t',b') and $|V_{t'b}| \ll |V_{tb'}|$. For a b' in a doublet with a charge -4/3 vector-like quark, the limit $m_{b'} > 1.14$ TeV is obtained.
- ¹² SIRUNYAN 18Q based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The limit is for the pair-produced vector-like b' that couple only to light quarks. Upper cross section limits on the single production of a b' and constraints for other decay channels (Zq and Hq) are also given in the paper.

⁷ The limit is for the singlet model, assuming that the branching ratios into Wt, Zb, hb add up to one.

- ¹³ SIRUNYAN 17AU based on 2.3–2.6 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Limit on pairproduced singlet vector-like b' using one lepton and several jets. The mass bound is given for a b' transforming as a singlet under the electroweak symmetry group, assumed to decay through W, Z or Higgs boson (which decays to jets) and to a third generation quark.
- ¹⁴ AAD 15Z based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Used events with $\ell + \not{E}_T + 26j$ ($\geq 1 b$) and at least one pair of jets from weak boson decay, primarily designed to select the signature $b'\overline{b'} \rightarrow WWt\overline{t} \rightarrow WWWWb\overline{b}$. This is a limit on pair-produced vector-like b'. The lower mass limit is 640 GeV for a vector-like singlet b'.
- ¹⁵ Result is based on 1.1 fb⁻¹ of data. No signal is found for the search of long-lived particles which decay into final states with two electrons or photons, and upper bound on the cross section times branching fraction is obtained for 2 < cτ < 7000 mm; see Fig. 3. 95% CL excluded region of b' lifetime and mass is shown in Fig. 4.
- ¹⁶ ACOSTA 03 looked for long-lived fourth generation quarks in the data sample of 90 pb^{-1} of $\sqrt{s}=1.8$ TeV $p\overline{p}$ collisions by using the muon-like penetration and anomalously high ionization energy loss signature. The corresponding lower mass bound for the charge (2/3)e quark (t') is 220 GeV. The t' bound is higher than the b' bound because t' is more likely to produce charged hadrons than b'. The 95% CL upper bounds for the production cross sections are given in their Fig. 3.
- ¹⁷ AAD 23AG based on 139 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Pair production of vectorlike top or bs is searched for in the mode $1\ell + \ge 4j(\ge 1b$ -tagged) + $\not\!\!E_T$. The data are consistent with the SM background predictions and limits are obtained for different branching ratios. Masses below 1.59 TeV are excluded assuming a mass-degenerate vector-like doublet (t',b') model.
- ¹⁸ SIRUNYAN 19AQ based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Pair production of vector-like b' is seached for with one b' decaying into Zb and the other b' decaying into Wt, Zb, hb. Events with an opposite-sign lepton pair consistent with coming from Z and jets are used. Mass limits are obtained for a variety of branching ratios of b'.
- ¹⁹ SIRUNYAN 19BW based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like b' using all-hadronic final state. The analysis is made for the Zb, Wt, hb modes and mass limits are obtained for a variety of branching ratios.
- ²⁰ AABOUD 18AW based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like b' using lepton-plus-jets final state. The search is also sensitive to the decays into Zb and Hb final states.
- ²¹ SIRUNYAN 18BM based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. The limit is for the pair-produced vector-like b'. Three channels (single lepton, same-charge 2 leptons, or at least 3 leptons) are considered for various branching fraction combinations. Assuming B(tW) = 1, the limit is 1240 GeV and for B(bZ) = 1 it is 960 GeV.
- ²² KHACHATRYAN 16AN based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on pairproduced vector-like b' using 1, 2, and >2 leptons as well as fully hadronic final states. Other limits depending on the branching fractions to tW, bZ, and bH are given in Table IX.
- ²³ AAD 15AR based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Used lepton-plus-jets final state. See Fig. 24 for mass limits in the plane of B($b' \rightarrow Wt$) vs. B($b' \rightarrow Hb$) from $b'\overline{b'} \rightarrow Hb + X$ searches.
- ²⁵ AAD 15BY based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on pair-produced chiral b'-quark. Used events containing $\geq 2\ell + \not \!\!E_T + \geq 2j$ ($\geq 1 b$) and including a same-sign lepton pair.

- ²⁷ Based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. No significant excess over SM expectation is found in the search for pair production or single production of b' in the events with dilepton from a high $p_T Z$ and additional jets ($\geq 1 b$ -tag). If instead of B($b' \rightarrow Wt$) = 1 an electroweak singlet with B($b' \rightarrow Wt$) ~ 0.45 is assumed, the limit reduces to 685 GeV.
- ²⁸ Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 13I looked for events with one isolated electron or muon, large E_T , and at least four jets with large transverse momenta, where one jet is likely to originate from the decay of a bottom quark.
- ²⁹ Based on 1.04 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. No signal is found for the search of heavy quark pair production that decay into W and a t quark in the events with a high p_T isolated lepton, large E_T , and at least 6 jets in which one, two or more dijets are from W.
- ³⁰ Based on 2.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. No $b' \rightarrow Zb$ invariant mass peak is found in the search of heavy quark pair production that decay into Z and a b quark in events with $Z \rightarrow e^+e^-$ and at least one b-jet. The lower mass limit is 358 GeV for a vector-like singlet b' mixing solely with the third SM generation.
- ³¹ Based on 1.04 fb⁻¹ of *pp* data at $\sqrt{s} = 7$ TeV. No signal is found for the search of heavy quark pair production that decay into *W* and a quark in the events with dileptons, large $\not\!\!E_T$, and ≥ 2 jets.
- 32 Based on 1.04 fb⁻¹ of pp data at \sqrt{s} = 7 TeV. AAD 12BE looked for events with two isolated like-sign leptons and at least 2 jets, large $\not\!\!\!E_T$ and H $_T\,>$ 350 GeV.
- ³³Based on 5 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 12BH searched for QCD and EW production of single and pair of degenerate 4'th generation quarks that decay to *bW* or *tW*. Absence of signal in events with one lepton, same-sign dileptons or trileptons gives the bound. With a mass difference of 25 GeV/c² between $m_{t'}$ and $m_{b'}$,

the corresponding limit shifts by about $\pm 20 \text{ GeV}/\text{c}^2$.

- ³⁴ Based on 4.9 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 12X looked for events with trileptons or same-sign dileptons and at least one b jet.
- ³⁶ Based on 34 pb⁻¹ of data in *pp* collisions at 7 TeV. CHATRCHYAN 11L looked for multijet events with trileptons or same-sign dileptons. No excess above the SM background excludes $m_{b'}$ between 255 and 361 GeV at 95% CL for B($b' \rightarrow Wt$) = 1.
- ³⁷ Based on 2.7 fb⁻¹ of data in $p\overline{p}$ collisions at $\sqrt{s} = 1.96$ TeV. AALTONEN 10H looked for pair production of heavy quarks which decay into tW^- or tW^+ , in events with same sign dileptons (e or μ), several jets and large missing E_T . The result is obtained for b' which decays into tW^- . For the charge 5/3 quark ($T_{5/3}$) which decays into tW^+ , $m_{T_{5/3}} > 365$ GeV (95% CL) is found when it has the charge -1/3 partner B of the same mass.
- ³⁸ FLACCO 10 result is obtained from AALTONEN 10H result of $m_{b'} > 338$ GeV, by relaxing the condition B($b' \rightarrow Wt$) = 100% when $m_{b'} > m_{t'}$.
- ³⁹ Result is based on 1.06 fb⁻¹ of data. No excess from the SM Z+jet events is found when Z decays into ee or $\mu\mu$. The $m_{b'}$ bound is found by comparing the resulting upper bound on $\sigma(b'\overline{b'})$ [1-(1-B($b' \rightarrow Zb$))²] and the LO estimate of the b' pair production cross section shown in Fig. 38 of the article.

- ⁴⁰ HUANG 08 reexamined the b' mass lower bound of 268 GeV obtained in AALTONEN 07C that assumes $B(b' \rightarrow Zb) = 1$, which does not hold for $m_{b'} > 255$ GeV. The lower mass bound is given in the plane of $\sin^2(\theta_{tb'})$ and $m_{b'}$.
- ⁴¹ AFFOLDER 00 looked for b' that decays in to b+Z. The signal searched for is bbZZ events where one Z decays into e^+e^- or $\mu^+\mu^-$ and the other Z decays hadronically. The bound assumes $B(b' \rightarrow Zb) = 100\%$. Between 100 GeV and 199 GeV, the 95%CL upper bound on $\sigma(b' \rightarrow \overline{b'}) \times B^2(b' \rightarrow Zb)$ is also given (see their Fig. 2).
- ⁴² ABE 98N looked for $Z \rightarrow e^+e^-$ decays with displaced vertices. Quoted limit assumes $B(b' \rightarrow Zb)=1$ and $c\tau_{b'}=1$ cm. The limit is lower than m_Z+m_b (~ 96 GeV) if $c\tau > 22$ cm or $c\tau < 0.009$ cm. See their Fig. 4.
- ⁴³ ABACHI 97D searched for b' that decays mainly via FCNC. They obtained 95%CL upper bounds on $B(b'\overline{b}' \rightarrow \gamma + 3 \text{ jets})$ and $B(b'\overline{b}' \rightarrow 2\gamma + 2 \text{ jets})$, which can be interpreted as the lower mass bound $m_{b'} > m_Z + m_b$.
- ⁴⁴ ABACHI 95F bound on the top-quark also applies to b' and t' quarks that decay predominantly into W. See FROGGATT 97.
- ⁴⁵ MUKHOPADHYAYA 93 analyze CDF dilepton data of ABE 92G in terms of a new quark decaying via flavor-changing neutral current. The above limit assumes $B(b' \rightarrow b\ell^+\ell^-)=1\%$. For an exotic quark decaying only via virtual Z [$B(b\ell^+\ell^-)=3\%$], the limit is 85 GeV.
- ⁴⁶ABE 92 dilepton analysis limit of >85 GeV at CL=95% also applies to b' quarks, as discussed in ABE 90B.
- 47 ABE 90B exclude the region 28–72 GeV.
- ⁴⁸ AKESSON 90 searched for events having an electron with p_T > 12 GeV, missing momentum > 15 GeV, and a jet with E_T > 10 GeV, $|\eta| < 2.2$, and excluded $m_{b'}$ a between 30 and 69 GeV.
- ⁴⁹ For the reduction of the limit due to non-charged-current decay modes, see Fig. 19 of ALBAJAR 90B.
- ⁵⁰ ALBAJAR 88 study events at $E_{\rm cm} = 546$ and 630 GeV with a muon or isolated electron, accompanied by one or more jets and find agreement with Monte Carlo predictions for the production of charm and bottom, without the need for a new quark. The lower mass limit is obtained by using a conservative estimate for the $b'\overline{b'}$ production cross section and by assuming that it cannot be produced in W decays. The value quoted here is revised using the full $O(\alpha_s^2)$ cross section of ALTARELLI 88.

- ¹ TUMASYAN 220 based on 138 fb⁻¹ of data in pp collisions at 13 TeV. No significant excess over SM expectation is found in the search for a left-handed b' assuming 100% decay to tW using a t-tagged jet and a lepton from W. The model assumes that the b' has the excited quark couplings. The bound is from a statistical combination with an earlier analysis by SIRUNYAN 21AG. The 95% CL bounds are also set as 3.0, 3.0, and 3.2 TeV, respectively, for left-handed, right-handed, and vector-like couplings.
- ² ABAZOV 11F based on 5.4 fb⁻¹ of data in ppbar collisions at 1.96 TeV. ABAZOV 11F looked for single production of b' via the W or Z coupling to the first generation up or down quarks, respectively. Model independent cross section limits for the single production processes $p\overline{p} \rightarrow b'q \rightarrow Wuq$, and $p\overline{p} \rightarrow b'q \rightarrow Zdq$ are given in Figs. 3 and 4, respectively, and the mass limits are obtained for the model of ATRE 09 with degenerate bi-doublets of vector-like quarks.
- ³ AAD 23CQ based on 139 fb⁻¹ of data in pp collisions at 13 TeV. No significant excess over SM expectation is found. Limits on mass and production cross section of a vector-like b' are obtained in several theoretical scenarios determined by the couplings betwen b' and W, Z, h.
- ⁴ SIRUNYAN 21AG based on 137 fb⁻¹ of data in pp collisions at 13 TeV. No significant excess over SM expectation is found in the search for a left-handed b' assuming 100% decay to tW using all hadronic final states, where t and W are tagged as single jets, respectively. The model assumes that the b' has the excited quark couplings. The 95% CL bounds are also set as 2.8 and 3.1 TeV, respectively, for the right-handed and vector-like couplings.
- ⁵ SIRUNYAN 19AI based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Exclusion limits are set on the product of the production cross section and branching fraction for the b'(-1/3) + b and b'(-1/3) + t modes as a function of the vector-like quark mass in Figs. 7 and 8 and in Tab. 2 for relative vector-like quark widths between 1 and 30% for left- and right-handed vector-like quark couplings. No significant deviation from the SM prediction is observed.
- ⁶AAD 16AH based on 20.3 fb⁻¹ of data in pp collisions at 8 TeV. No significant excess over SM expectation is found in the search for a vector-like b' in the single-lepton and dilepton channels (ℓ or $\ell\ell$) + 1,2,3 j ($\geq 1b$). The model assumes that the b' has the excited quark couplings.
- ⁷ Based on 19.7 fb⁻¹ of data in pp collisions at 8 TeV. Limit on left-handed b' assuming 100% decay to tW and using all-hadronic, lepton + jets, and dilepton final states.
- ⁸ Based on 19.7 fb⁻¹ of data in pp collisions at 8 TeV. Limit on right-handed b' assuming 100% decay to tW and using all-hadronic, lepton + jets, and dilepton final states.
- ⁹ Based on 19.7 fb⁻¹ of data in pp collisions at 8 TeV. Limit on vector-like b' assuming 100% decay to tW and using all-hadronic, lepton+jets, and dilepton final states.

MASS LIMITS for b' (4th Generation) Quark or Hadron in e^+e^- Collisions

Search for hadrons containing a fourth-generation -1/3 quark denoted b'.

The last column specifies the assumption for the decay mode (CC denotes the conventional charged-current decay) and the event signature which is looked for.

¹ DECAMP 90F looked for isolated charged particles, for isolated photons, and for four-jet final states. The modes $b' \rightarrow bg$ for $B(b' \rightarrow bg) > 65\% b' \rightarrow b\gamma$ for $B(b' \rightarrow b\gamma) > 5\%$ are excluded. Charged Higgs decay were not discussed. ² ABDALLAH 07 searched for b' pair production at E_{cm} =196-209 GeV, with 420 pb⁻¹.

- ² ABDALLAH 07 searched for b' pair production at $E_{\rm cm}$ =196–209 GeV, with 420 pb⁻¹. No signal leads to the 95% CL upper limits on B($b' \rightarrow bZ$) and B($b' \rightarrow cW$) for $m_{b'}$ = 96 to 103 GeV.
- ³ ADRIANI 93G search for vector quarkonium states near Z and give limit on quarkonium-Z mixing parameter $\delta m^2 < (10-30) \text{ GeV}^2$ (95%CL) for the mass 88–94.5 GeV. Using Richardson potential, a 1S ($b'\overline{b}'$) state is excluded for the mass range 87.7–94.7 GeV. This range depends on the potential choice.

⁴ ABREU 90D assumed $m_{H^-} < m_{b'} - 3$ GeV.

⁵ Superseded by ABREU 91F.

 6 AKRAWY 90B search was restricted to data near the Z peak at $E_{\rm cm}=91.26~{\rm GeV}$ at LEP. The excluded region is between 23.6 and 41.4 GeV if no H^+ decays exist. For charged Higgs decays the excluded regions are between $(m_{H^+}~+~1.5~{\rm GeV})$ and 45.5 GeV.

- ⁷AKRAWY 90J search for isolated photons in hadronic Z decay and derive
- $B(Z \rightarrow b' \overline{b'}) \cdot B(b' \rightarrow \gamma X) / B(Z \rightarrow hadrons) < 2.2 \times 10^{-3}$. Mass limit assumes $B(b' \rightarrow \gamma X) > 10\%$.
- ⁸ABE 89E search at $E_{\rm cm} = 56-57$ GeV at TRISTAN for multihadron events with a spherical shape (using thrust and acoplanarity) or containing isolated leptons.
- $^9\,{\rm ABE}$ 89G search was at $E_{\rm cm}$ = 55–60.8 GeV at TRISTAN.
- ¹⁰ If the photonic decay mode is large (B($b' \rightarrow b\gamma$) > 25%), the ABRAMS 89C limit is 45.4 GeV. The limit for for Higgs decay ($b' \rightarrow cH^-$, $H^- \rightarrow \overline{c}s$) is 45.2 GeV.
- 11 ADACHI 89C search was at $E_{\rm cm}=56.5{-}60.8~{\rm GeV}$ at TRISTAN using multi-hadron events accompanying muons.
- 12 ADACHI 89C also gives limits for any mixture of C C and bg decays.
- 13 ENO 89 search at $E_{\rm cm} = 50-60.8$ at TRISTAN.
- 14 ENO 89 considers arbitrary mixture of the charged current, bg, and $b\gamma$ decays.
- ¹⁵ IGARASHI 88 searches for leptons in low-thrust events and gives $\Delta R(b') < 0.26$ (95% CL) assuming charged current decay, which translates to $m_{b'} > 24.4$ GeV.
- 16 SAGAWA 88 set limit $\sigma(top) < 6.1$ pb at CL=95% for top-flavored hadron production from event shape analyses at $E_{\rm CM} = 52$ GeV. By using the quark parton model cross-section formula near threshold, the above limit leads to lower mass bounds of 23.8 GeV for charge -1/3 quarks.
- ¹⁷ ADEVA 86 give 95%CL upper bound on an excess of the normalized cross section, ΔR , as a function of the minimum c.m. energy (see their figure 3). Production of a pair of 1/3 charge quarks is excluded up to $E_{\rm cm} = 45.4$ GeV.
- ¹⁸ ALTHOFF 84C narrow state search sets limit $\Gamma(e^+e^-)$ B(hadrons) <2.4 keV CL = 95% and heavy charge 1/3 quark pair production m > 21 GeV, CL = 95%.
- ¹⁹ ALTHOFF 841 exclude heavy quark pair production for 7 < m <19 GeV (1/3 charge) using aplanarity distributions (CL = 95%).
