H^{\pm} (charged Higgs) mass limits for m_{H^+} < m(top) H^{\pm} (charged Higgs) mass limits for m_{H^+} > m(top) H^{\pm\pm} (doubly-charged Higgs boson) mass limits — Limits for H^{\pm\pm} with T_3=\pm 1 — Limits for H^{\pm\pm} with T_3=0
```

### $H^{\pm}$ (charged Higgs) mass limits for $m_{H^{+}} < m(top)$

Unless otherwise stated, LEP limits assume B( $H^+ \to \tau^+ \nu$ )+B( $H^+ \to c\overline{s}$ )=1, and hold for all values of B( $H^+ \to \tau^+ \nu_{\tau}$ ), and assume  $H^+$  weak isospin of  $T_3$ =+1/2. In the following,  $\tan\beta$  is the ratio of the two vacuum expectation values in two-doublet models (2HDM).

The limits are also applicable to point-like technipions. For a discussion of techniparticles, see the Review of Dynamical Electroweak Symmetry Breaking in this Review.

Limits obtained at the LHC are given in the  $\mathbf{m}_h^{mod-}$  benchmark scenario, see CARENA 13, and hold for all  $\tan\!\beta$  values.

For limits obtained in hadronic collisions before the observation of the top quark, and based on the top mass values inconsistent with the current measurements, see the 1996 (Physical Review **D54** 1 (1996)) Edition of this Review.

Searches in  $e^+e^-$  collisions at and above the Z pole have conclusively ruled out the existence of a charged Higgs in the region  $m_{H^+}\lesssim 45$  GeV, and are meanwhile superseded by the searches in higher energy  $e^+e^-$  collisions at LEP. Results that are by now obsolete are therefore not included in this compilation, and can be found in a previous Edition (The European Physical Journal **C15** 1 (2000)) of this Review.

In the following, and unless otherwise stated, results from the LEP experiments (ALEPH, DELPHI, L3, and OPAL) are assumed to derive from the study of the  $e^+e^- \rightarrow H^+H^-$  process. Limits from  $b \rightarrow s \gamma$  decays are usually stronger in generic 2HDM models than in Supersymmetric models.

- $^1$  AAD 15AF search for  $t\,\overline{t}$  production followed by  $t\to b\,H^+$ ,  $H^+\to \tau^+\,\nu$  in 19.5 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=8$  TeV. Upper limits on B( $t\to b\,H^+$ ) B( $H^+\to \tau\nu$ ) between  $2.3\times 10^{-3}$  and  $1.3\times 10^{-2}$  (95% CL) are given for  $m_{H^+}=80$ –160 GeV. See their Fig. 8 for the excluded regions in different benchmark scenarios of the MSSM. The region  $m_{H^+}<140$  GeV is excluded for  $\tan\beta>1$  in the considered scenarios.
- $^2$  KHACHATRYAN 15AX search for  $t\,\overline{t}$  production followed by  $t\to b\,H^+$ ,  $H^+\to \tau^+\nu$  in 19.7 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=8$  TeV. Upper limits on B( $t\to b\,H^+$ ) B( $H^+\to \tau\nu$ ) between  $1.2\times 10^{-2}$  and  $1.5\times 10^{-3}$  (95% CL) are given for  $m_{H^+}=80$ –160 GeV. See their Fig. 11 for the excluded regions in different benchmark scenarios of the MSSM. The region  $m_{H^+}<155$  GeV is excluded for  $\tan\beta>1$  in the considered scenarios.
- <sup>3</sup> LEP 13 give a limit that refers to the Type II scenario. The limit for B( $H^+ \to \tau \nu$ ) = 1 is 94 GeV (95% CL), and for B( $H^+ \to cs$ ) = 1 the region below 80.5 as well as the region 83–88 GeV is excluded (95% CL). LEP 13 also search for the decay mode  $H^+ \to A^0 W^*$  with  $A^0 \to b \bar{b}$ , which is not negligible in Type I models. The limit in Type I models is 72.5 GeV (95% CL) if  $m_{A^0} > 12$  GeV.
- <sup>4</sup> ABBIENDI 12 also search for the decay mode  $H^+ \rightarrow A^0 W^*$  with  $A^0 \rightarrow b \overline{b}$ .
- <sup>5</sup> AAD 23AH search for vector boson fusion production of  $H^\pm$  decaying to  $H^\pm \to W^\pm Z \to \ell^\pm \nu \ell^+ \ell^-$  in 139 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 9 for limits on cross section times branching ratio in the Georgi-Machacek model for  $m_{H^\pm}=0.2$ –1.0 TeV, and also for limits on the triplet vacuum expectation value fraction.
- <sup>6</sup> AAD 23BB search for  $t\overline{t}$  production followed by  $t\to bH^+$ ,  $H^+\to c\overline{b}$  in 139 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 8 for limits on the product of branching ratios for  $m_{H^+}=60$ –160 GeV.
- <sup>7</sup> Charge conjugated states are also implied.
- <sup>8</sup> AAD 23BW search for  $t \to bH^+$  from pair produced top quarks, with the decay chain  $H^+ \to W^+ A^0$ ,  $A^0 \to \mu^+ \mu^-$  using 139 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 5(b)-(d) for limits on the product of branching ratios for  $m_{H^+}=120$ , 140, 160 GeV, and  $m_{\Delta^0}=15$ –72 GeV.

- <sup>9</sup> TUMASYAN 23AV search for production of  $H^\pm$  in association with a top quark, decaying to  $H_2^0$   $W^\pm$ ,  $H_2^0 \to \tau^+ \tau^-$ , using 138 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 9 for limits on production cross section times branching ratios for  $m_{H^\pm}=0.3$ –0.7 TeV and  $m_{H_2^0}=0.2$  TeV.
- $^{10}$  TUMASYAN 22B search for production of scalar resonance decaying to  $W^{\pm}\gamma \to q\,q\gamma$  in 137 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 5 for limits on cross section times branching ratio for the mass range 0.7–6.0 TeV, assuming narrow width or  $\Gamma/M=0.05$ .
- ^{11} AAD 21V search for  $\overline{t}\,b\,H^+$  associated production followed by  $H^+ \to t\,\overline{b}$  in 139 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 6 for upper limits on cross section times branching ratio for  $m_{H^+}=0.2$ –2 TeV. See also their Fig. 7 for the excluded region in the parameter space of the hMSSM and the following MSSM benchmark scenarios:  $M_h^{125}$ ,  $M_h^{125}(\widetilde{\chi})$ ,  $M_h^{125}(\widetilde{\tau})$ ,  $M_h^{125}({\rm alignment})$ ,  $M_{h_1}^{125}({\rm CPV})$ .
- $^{12}$  SIRUNYAN 21W search for vector boson fusion production of  $H^+$  decaying to  $H^+ \to W^+ Z \to \ell^+ \nu \ell^+ \ell^-$  in 137 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 8 for limits on cross section times branching ratio for  $m_{H^+}=0.2$ –3.0 TeV, and also for limits on the fraction of the triplet vev contribution to the W mass in the Georgi-Machacek model.
- $^{13}$  AAD 20W search for dijet resonances in events with isolated leptons using 139 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. As a byproduct,  $H^+\to t\overline{b}$  produced in association with  $\overline{t}b$  is searched for. Limits on the product of cross section times branching ratio for  $m_{H^+}=0.6$ –2 TeV are given in their Fig. 5(c).
- <sup>14</sup> SIRUNYAN 20AO search for  $H^+ \to t \, \overline{b}$  produced in association with t(b) in all jet final states in 35.9 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 6 for limits on the product of cross section times branching ratio for  $m_{H^+}=0.2$ –3 TeV. Limits for s-channel production are also given for  $m_{H^+}=0.8$ –3 TeV. See also Fig. 7 for the corresponding limits in scenarios in the minimal supersymmetric standard model. Cross section limits from combined results with SIRUNYAN 20AV are given in Fig. 8.
- $^{15}$  SIRUNYAN 20AV search for  $H^+\to t\,\overline{b}$  produced in association with t(b) in final states with one or two leptons, in 35.9 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 5 for limits on the product of cross section times branching ratio for  $m_{H^+}=0.2\text{--}3$  TeV, and their Fig. 6 for the corresponding limits in scenarios in the minimal supersymmetric standard model.
- <sup>16</sup> SIRUNYAN 20BE search for  $t \to bH^+$  followed by the decay  $H^+ \to c\overline{s}$  in pair produced top quark events using 35.9 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=13$  TeV. Limits on the branching ratio in the range 1.68–0.25% (95%CL) are given for  $m_{H^+}=80$ –160 GeV, see their Fig. 4.
- $^{17}$  SIRUNYAN 19AH search for  $H^+$  in the decay of a pair-produced t quark, or in associated  $t\,b\,H^+$  or nonresonant  $b\,\overline{b}\,H^+\,W^-$  production, followed by  $H^+\to\,\tau^+\,\nu$ , in 35.9 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=13$  TeV. Upper limits on cross section times branching ratio between 6 pb and 5 fb (95% CL) are given for  $m_{H^+}=80$ –3000 GeV (including the non-resonant production near the top quark mass), see their Fig. 6 (left). See their Fig. 6 (right) for the excluded regions in the  $m_h^{\rm mod}-$  scenario of the MSSM.
- $^{18}$  SIRUNYAN 19BP search for vector boson fusion production of  $H^+$  decaying to  $H^+ \to W^+ Z \to \ell^+ \nu \ell^+ \ell^-$  in 35.9 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 7 for limits on cross section times branching ratio for  $m_{H^+}=0.3$ –2.0 TeV, and also for limits on the fraction of the triplet vev contribution to the W mass in the Georgi-Machacek model.
- <sup>19</sup> SIRUNYAN 19CC search for  $t\to bH^+$  from pair produced top quarks, with the decay chain  $H^+\to W^+A^0$ ,  $A^0\to \mu^+\mu^-$  in 35.9 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 2 for limits on the product of branching ratios for  $m_{A^0}=15$ –75 GeV.

- $^{20}$  SIRUNYAN 19CQ search for vector boson fusion production of  $H^+$  decaying to  $H^+ \to W^+ Z \to \ell^+ \nu \, q \overline{q}$  or  $q \overline{q} \ell^+ \ell^-$  in 35.9 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 5 for limits on cross section times branching ratio for  $m_{H^+}=0.6$ –2.0 TeV, and also for limits on the triplet vacuum expectation value fraction in the Georgi-Machacek model.
- 21 AABOUD 18BW search for  $\overline{t}\,b\,H^+$  associated production or the decay  $t\to b\,H^+$ , followed by  $H^+\to \tau^+\nu$ , in 36.1 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 8(a) for upper limits on cross section times branching ratio for  $m_{H^+}=90$ –2000 GeV, and Fig. 8(b) for limits on B( $t\to b\,H^+$ ) B( $H^+\to \tau^+\nu$ ) for  $m_{H^+}=90$ –160 GeV. See also their Fig. 9 for the excluded region in the hMSSM parameter space.
- ^22 AABOUD 18CD search for  $\overline{t}bH^+$  associated production followed by  $H^+ \to t \, \overline{b}$  in 36.1 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 8 for upper limits on cross section times branching ratio for  $m_{H^+}=0.2$ –2 TeV. See also their Fig. 9 for the excluded region in the parameter space of the  $m_h^{\rm mod}-$  and hMSSM scenarios of the MSSM. The theory predictions overlaid to the experimental limits to determine the excluded  $m_{H^+}$  range are shown without their respective uncertainty band.
- $^{23}$  AABOUD 18CH search for vector boson fusion production of  $H^\pm$  decaying to  $H^\pm \to W^\pm Z \to \ell^\pm \nu \ell^+ \ell^-$  in 36.1 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 7 for limits on cross section times branching ratio for  $m_{H^\pm}=0.2$ –0.9 TeV, and also for limits on the triplet vacuum expectation value fraction in the Georgi-Machacek model.
- <sup>24</sup> HALLER 18 give 95% CL lower limits on  $m_{H^+}$  of 590 GeV in type II two Higgs doublet model from combined data (including an unpublished BELLE result) for B( $b \rightarrow s \gamma$ ).
- <sup>25</sup> SIRUNYAN 18DO search for  $t\overline{t}$  production followed by  $t\to bH^+$ ,  $H^+\to c\overline{b}$  in 19.7 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=8$  TeV. See their Fig. 3 for upper limits on B( $t\to bH^+$ ) for  $m_{H^+}=90$ –150 GeV assuming that B( $H^+\to c\overline{b}$ ) = 1 and B( $H^+\to bH^+$ ) + B( $H^+\to bH^+$ ) = 1.
- <sup>26</sup> MISIAK 17 give 95% CL lower limits on  $m_{H^+}$  between 570 and 800 GeV in type II two Higgs doublet model from combined data (including an unpublished BELLE result) for B( $b \to s(d)\gamma$ ).
- $^{27}$  SIRUNYAN 17AE search for vector boson fusion production of  $H^\pm$  decaying to  $H^\pm \to W^\pm Z \to \ell^\pm \nu \ell^+ \ell^-$  in 15.2 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 3 for limits on cross section times branching ratio for  $m_{H^\pm}=0.2$ –2.0 TeV, and also for limits on the triplet vacuum expectation value fraction in the Georgi-Machacek model.
- $^{28}$  AABOUD 16A search for t(b)  $H^\pm$  associated production followed by  $H^+\to \tau^+\nu$  in 3.2 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. Upper limits on  $\sigma(t(b)$   $H^\pm)$  B( $H^+\to \tau\nu$ ) between 1.9 pb and 15 fb (95% CL) are given for  $m_{H^+}=200$ –2000 GeV, see their Fig. 6. See their Fig. 7 for the excluded regions in the hMSSM scenario.
- <sup>29</sup> AAD 16AJ search for t(b)  $H^\pm$  associated production followed by  $H^\pm \to tb$  in 20.3 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=8$  TeV. See their Fig. 6 for upper limits on  $\sigma(t(b)$   $H^\pm)$  B( $H^+ \to tb$ ) for  $m_{H^+}=200$ –600 GeV.
- <sup>30</sup> AAD 16AJ search for  $H^{\pm}$  production from quark-antiquark annihilation, followed by  $H^{\pm} \to tb$ , in 20.3 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=8$  TeV. See their Fig. 10 for upper limits on  $\sigma(H^{\pm})$  B( $H^{+} \to tb$ ) for  $m_{H^{+}}=400$ –3000 GeV.
- <sup>31</sup> AAD 15AF search for  $t\,H^\pm$  associated production followed by  $H^\pm\to \tau^\pm\nu$  in 19.5 fb<sup>-1</sup> of  $p\,p$  collisions at  $E_{\rm cm}=8$  TeV. Upper limits on  $\sigma(t\,H^\pm)$  B( $H^+\to \tau\nu$ ) between 760 and 4.5 fb (95% CL) are given for  $m_{H^+}=180$ –1000 GeV. See their Fig. 8 for the excluded regions in different benchmark scenarios of the MSSM.
- $^{32}$  AAD 15M search for vector boson fusion production of  $H^\pm$  decaying to  $H^\pm\to~W^\pm~Z\to q\,\overline{q}\,\ell^+\,\ell^-$  in 20.3 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=8$  TeV. See their Fig. 2 for limits on

- cross section times branching ratio for  $m_{H^\pm}=200$ –1000 GeV, and Fig. 3 for limits on the triplet vacuum expectation value fraction in the Georgi-Machacek model.
- $^{33}$  KHACHATRYAN 15AX search for  $tH^\pm$  associated production followed by  $H^\pm\to tb$  in 19.7 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=8$  TeV. Upper limits on  $\sigma(tH^\pm)$  B( $H^+\to t\overline{b}$ ) between 2.0 and 0.13 pb (95% CL) are given for  $m_{H^+}=180$ –600 GeV. See their Fig. 11 for the excluded regions in different benchmark scenarios of the MSSM.
- $^{34}$  KHACHATRYAN 15AX search for  $t\,H^\pm$  associated production followed by  $H^\pm\to\tau^\pm\nu$  in 19.7 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=8$  TeV. Upper limits on  $\sigma(t\,H^\pm)$  B( $H^+\to\tau\nu$ ) between 380 and 25 fb (95% CL) are given for  $m_{H^+}=180$ –600 GeV. See their Fig. 11 for the excluded regions in different benchmark scenarios of the MSSM.
- $^{35}$  KHACHATRYAN 15BF search for  $t\overline{t}$  production followed by  $t \to bH^+$ ,  $H^+ \to c\overline{s}$  in 19.7 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=8$  TeV. Upper limits on B( $t \to bH^+$ ) B( $H^+ \to c\overline{s}$ ) between  $1.2 \times 10^{-2}$  and  $6.5 \times 10^{-2}$  (95% CL) are given for  $m_{H^+}=90$ –160 GeV.
- $^{36}$  AAD 14M search for the decay cascade  $H_2^0 o H^\pm W^\mp o H^0 W^\pm W^\mp$ ,  $H^0$  decaying to  $b\overline{b}$  in 20.3 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=8$  TeV. See their Table III for limits on cross section times branching ratio for  $m_{H_2^0}=325-1025$  GeV and  $m_{H^+}=225-925$  GeV.
- <sup>37</sup> AALTONEN 14A measure B( $t \to b au 
  u$ ) = 0.096  $\pm$  0.028 using 9 fb<sup>-1</sup> of  $p \overline{p}$  collisions at  $E_{\rm cm}=1.96$  TeV. For  $m_{H^+}=80$ –140 GeV, this measured value is translated to a limit B( $t \to b H^+$ ) < 0.059 at 95% CL assuming B( $H^+ \to \tau^+ 
  u$ ) = 1.
- <sup>38</sup> AAD 13AC search for  $t\,\overline{t}$  production followed by  $t\to b\,H^+$ ,  $H^+\to c\,\overline{s}$  (flavor unidentified) in 4.7 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=7$  TeV. Upper limits on B( $t\to b\,H^+$ ) between 0.05 and 0.01 (95%CL) are given for  $m_{H^+}=90$ –150 GeV and B( $H^+\to c\,\overline{s}$ )=1.
- $^{39}$  AAD 13V search for  $t\overline{t}$  production followed by  $t\to bH^+$ ,  $H^+\to \tau^+\nu$  through violation of lepton universality with 4.6 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=7$  TeV. Upper limits on B( $t\to bH^+$ ) between 0.032 and 0.044 (95% CL) are given for  $m_{H^+}=90$ –140 GeV and B( $H^+\to \tau^+\nu$ ) = 1. By combining with AAD 12BH, the limits improve to 0.008 to 0.034 for  $m_{H^+}=90$ –160 GeV. See their Fig. 7 for the excluded region in the  $m_h^{\rm max}$  scenario of the MSSM.
- <sup>40</sup> AAD 12BH search for  $t\,\overline{t}$  production followed by  $t\to b\,H^+$ ,  $H^+\to \tau^+\nu$  with 4.6 fb<sup>-1</sup> of  $p\,p$  collisions at  $E_{\rm cm}=7$  TeV. Upper limits on B( $t\to b\,H^+$ ) between 0.01 and 0.05 (95% CL) are given for  $m_{H^+}=90$ –160 GeV and B( $H^+\to \tau^+\nu$ ) = 1. See their Fig. 8 for the excluded region in the  $m_h^{\rm max}$  scenario of the MSSM.
- <sup>41</sup> CHATRCHYAN 12AA search for  $t\overline{t}$  production followed by  $t\to bH^+$ ,  $H^+\to \tau^+\nu$  with 2 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=7$  TeV. Upper limits on B( $t\to bH^+$ ) between 0.019 and 0.041 (95% CL) are given for  $m_{H^+}=80$ –160 GeV and B( $H^+\to \tau^+\nu$ )=1.
- <sup>42</sup> AALTONEN 11P search in 2.7 fb $^{-1}$  of  $p\overline{p}$  collisions at  $E_{\rm cm}=1.96$  TeV for the decay chain  $t\to bH^+$ ,  $H^+\to W^+A^0$ ,  $A^0\to \tau^+\tau^-$  with  $m_{A^0}$  between 4 and 9 GeV. See their Fig. 4 for limits on B( $t\to bH^+$ ) for 90  $< m_{H^+} < 160$  GeV.
- <sup>43</sup> DESCHAMPS 10 make Type II two Higgs doublet model fits to weak leptonic and semileptonic decays,  $b \to s \gamma$ , B,  $B_s$  mixings, and  $Z \to b \overline{b}$ . The limit holds irrespective of  $\tan \beta$ .
- <sup>44</sup> AALTONEN 09AJ search for  $t \to bH^+$ ,  $H^+ \to c\overline{s}$  in  $t\overline{t}$  events in 2.2 fb<sup>-1</sup> of  $p\overline{p}$  collisions at  $E_{\rm cm}=1.96$  TeV. Upper limits on B( $t \to bH^+$ ) between 0.08 and 0.32 (95% CL) are given for  $m_{H^+}=60$ –150 GeV and B( $H^+ \to c\overline{s}$ ) = 1.
- <sup>45</sup> ABAZOV 09AC search for  $t \to bH^+$ ,  $H^+ \to \tau^+ \nu$  in  $t\overline{t}$  events in 0.9 fb<sup>-1</sup> of  $p\overline{p}$  collisions at  $E_{\rm cm}=1.96$  TeV. Upper limits on B( $t \to bH^+$ ) between 0.19 and 0.25

- (95% CL) are given for  $m_{H^+}=$  80–155 GeV and B( $H^+\to \tau^+\nu$ ) = 1. See their Fig. 4 for an excluded region in a MSSM scenario.
- <sup>46</sup> ABAZOV 09AG measure  $t\,\overline{t}$  cross sections in final states with  $\ell$  + jets ( $\ell$  = e,  $\mu$ ),  $\ell\ell$ , and  $\tau\ell$  in 1 fb<sup>-1</sup> of  $p\,\overline{p}$  collisions at  $E_{\rm cm}=1.96$  TeV, which constrains possible  $t\to bH^+$  branching fractions. Upper limits (95% CL) on B( $t\to bH^+$ ) between 0.15 and 0.40 (0.48 and 0.57) are given for B( $H^+\to \tau^+\nu$ ) = 1 (B( $H^+\to c\,\overline{s}$ ) = 1) for  $m_{H^+}=80$ –155 GeV.
- 47 ABAZOV 09AI search for  $t \to bH^+$  in  $t\overline{t}$  events in 1 fb $^{-1}$  of  $p\overline{p}$  collisions at  $E_{\rm cm}=1.96$  TeV. Final states with  $\ell$  + jets ( $\ell=e,\mu$ ),  $\ell\ell$ , and  $\tau\ell$  are examined. Upper limits on B( $t \to bH^+$ ) (95% CL) between 0.15 and 0.19 (0.19 and 0.22) are given for B( $H^+ \to \tau^+ \nu$ ) = 1 (B( $H^+ \to c\overline{s}$ ) = 1) for  $m_{H^+}=80$ –155 GeV. For B( $H^+ \to \tau^+ \nu$ ) = 1 also a simultaneous extraction of B( $t \to bH^+$ ) and the  $t\overline{t}$  cross section is performed, yielding a limit on B( $t \to bH^+$ ) between 0.12 and 0.26 for  $m_{H^+}=80$ –155 GeV. See their Figs. 5–8 for excluded regions in several MSSM scenarios.
- <sup>48</sup> ABAZOV 09P search for  $H^+$  production by  $q \, \overline{q}'$  annihilation followed by  $H^+ \to t \, \overline{b}$  decay in 0.9 fb $^{-1}$  of  $p \, \overline{p}$  collisions at  $E_{\rm cm} = 1.96$  TeV. Cross section limits in several two-doublet models are given for  $m_{H^+} = 180$ –300 GeV. A region with 20  $\lesssim \tan \beta \lesssim$  70 is excluded (95% CL) for 180 GeV  $\lesssim m_{H^+} \lesssim$  184 GeV in type-I models.
- <sup>49</sup> ABULENCIA 06E search for associated  $H^0$  W production in  $p\overline{p}$  collisions at  $E_{\rm cm}=1.96$  TeV. A fit is made for  $t\overline{t}$  production processes in dilepton, lepton + jets, and lepton  $+\tau$  final states, with the decays  $t\to W^+b$  and  $t\to H^+b$  followed by  $H^+\to \tau^+\nu$ ,  $c\overline{s}$ ,  $t^*\overline{b}$ , or  $W^+H^0$ . Within the MSSM the search is sensitive to the region  $\tan\beta<1$  or >30 in the mass range  $m_{H^+}=80$ –160 GeV. See Fig. 2 for the excluded region in a certain MSSM scenario.
- 50 ABDALLAH 04I search for  $e^+e^- \rightarrow H^+H^-$  with  $H^\pm$  decaying to  $\tau\nu$ , cs, or  $W^*A^0$  in Type-I two-Higgs-doublet models.
- $^{51}$  ABBIENDI 03 give a limit  $m_{H^+}>1.28{\rm tan}\beta$  GeV (95%CL) in Type II two-doublet \_\_ models.
- <sup>52</sup> ABAZOV 02B search for a charged Higgs boson in top decays with  $H^+ \to \tau^+ \nu$  at  $E_{\rm cm} = 1.8$  TeV. For  $m_{H^+} = 75$  GeV, the region  $\tan \beta > 32.0$  is excluded at 95%CL. The excluded mass region extends to over 140 GeV for  $\tan \beta$  values above 100.
- <sup>53</sup> BORZUMATI 02 point out that the decay modes such as  $b\overline{b}W$ ,  $A^0W$ , and supersymmetric ones can have substantial branching fractions in the mass range explored at LEP II and Tevatron.
- $^{54}$  ABBIENDI 01Q give a limit  $\tan\!\beta/m_{H^+} < 0.53~{\rm GeV}^{-1}$  (95%CL) in Type II two-doublet \_\_ models.
- <sup>55</sup> BARATE 01E give a limit  $\tan\beta/m_{H^+} < 0.40~{\rm GeV}^{-1}$  (90% CL) in Type II two-doublet models. An independent measurement of  $B \to \tau \nu_{\tau} {\rm X}$  gives  $\tan\beta/m_{H^+} < 0.49~{\rm GeV}^{-1}$  (90% CL).
- <sup>56</sup> GAMBINO 01 use the world average data in the summer of 2001 B( $b \to s \gamma$ ) = (3.23  $\pm$  0.42)  $\times$  10<sup>-4</sup>. The limit applies for Type-II two-doublet models.
- <sup>57</sup> AFFOLDER 00I search for a charged Higgs boson in top decays with  $H^+ \to \tau^+ \nu$  in  $p\overline{p}$  collisions at  $E_{\rm cm}{=}1.8$  TeV. The excluded mass region extends to over 120 GeV for  $\tan\beta$  values above 100 and B $(\tau\nu)=1$ . If B $(t\to bH^+)\gtrsim$  0.6,  $m_{H^+}$  up to 160 GeV is excluded. Updates ABE 97L.
- <sup>58</sup> ABBOTT 99E search for a charged Higgs boson in top decays in  $p\overline{p}$  collisions at  $E_{\rm cm}=1.8$  TeV, by comparing the observed  $t\overline{t}$  cross section (extracted from the data assuming the dominant decay  $t \to bW^+$ ) with theoretical expectation. The search is sensitive to regions of the domains  $\tan\beta \lesssim 1$ ,  $50 < m_{H^+}({\rm GeV}) \lesssim 120$  and  $\tan\beta \gtrsim 40$ ,  $50 < m_{H^+}({\rm GeV}) \lesssim 160$ . See Fig. 3 for the details of the excluded region.

- <sup>59</sup> ACKERSTAFF 99D measure the Michel parameters  $\rho$ ,  $\xi$ ,  $\eta$ , and  $\xi\delta$  in leptonic  $\tau$  decays from  $Z\to \tau\tau$ . Assuming e- $\mu$  universality, the limit  $m_{H^+}>0.97$  tan $\beta$  GeV (95%CL) is obtained for two-doublet models in which only one doublet couples to leptons.
- $^{60}$  ACCIARRI 97F give a limit  $m_{H^+}>2.6~{
  m tan}\beta$  GeV (90% CL) from their limit on the exclusive  $B\to~ au~
  u_{ au}$  branching ratio.
- <sup>61</sup> AMMAR 97B measure the Michel parameter  $\rho$  from  $\tau \to e \nu \nu$  decays and assumes  $e/\mu$  universality to extract the Michel  $\eta$  parameter from  $\tau \to \mu \nu \nu$  decays. The measurement is translated to a lower limit on  $m_{H^+}$  in a two-doublet model  $m_{H^+} > 0.97 \tan \beta$  GeV (90% CL).
- <sup>62</sup>COARASA 97 reanalyzed the constraint on the  $(m_{H^\pm}, \tan\beta)$  plane derived from the inclusive  $B \to \tau \nu_{\tau} X$  branching ratio in GROSSMAN 95B and BUSKULIC 95. They show that the constraint is quite sensitive to supersymmetric one-loop effects.
- <sup>63</sup> GUCHAIT 97 studies the constraints on  $m_{H^+}$  set by Tevatron data on  $\ell \tau$  final states in  $t \bar{t} \to (W \, b) (H \, b), \, W \to \ell \nu, \, H \to \tau \nu_{\tau}$ . See Fig. 2 for the excluded region.
- <sup>64</sup> MANGANO 97 reconsiders the limit in ACCIARRI 97F including the effect of the potentially large  $B_c \to ~ au 
  u_{ au}$  background to  $B_{ extstyle U} \to ~ au 
  u_{ au}$  decays. Stronger limits are obtained.
- $^{65}$  STAHL 97 fit au lifetime, leptonic branching ratios, and the Michel parameters and derive limit  $m_{H^+} > 1.5 an\! eta$  GeV (90% CL) for a two-doublet model. See also STAHL 94.
- $^{66}$  ALAM 95 measure the inclusive  $b\to s\gamma$  branching ratio at  $\Upsilon(4S)$  and give B(b  $\to s\gamma)<4.2\times 10^{-4}$  (95% CL), which translates to the limit  $m_{H^+}>[244+63/(\tan\beta)^{1.3}]$  GeV in the Type II two-doublet model. Light supersymmetric particles can invalidate this bound.
- 67 BUSKULIC 95 give a limit  $m_{H^+}>1.9~{\rm tan}\beta$  GeV (90% CL) for Type-II models from  $b\to \tau \nu_{\tau} X$  branching ratio, as proposed in GROSSMAN 94.

#### - $H^{\pm}$ (charged Higgs) mass limits for $\mathsf{m}_{H^{\pm}} > \mathsf{m}(\mathsf{top})$ ——

Limits obtained at the LHC are given in the  $\mathbf{m}_h^{mod-}$  benchmark scenario, see CARENA 13, and depend on the  $\tan\!\beta$  values.

#### - $\mathit{H}^{\pm\pm}$ (doubly-charged Higgs boson) mass limits -

This section covers searches for a doubly-charged Higgs boson with couplings to lepton pairs. Its weak isospin  $T_3$  is thus restricted to two possibilities depending on lepton chiralities:  $T_3(H^{\pm\pm})=\pm 1$ , with the coupling  $g_{\ell\ell}$  to  $\ell_L^-\ell_L^{\prime-}$  and  $\ell_R^+\ell_R^{\prime+}$  ("left-handed") and  $T_3(H^{\pm\pm})=0$ , with the coupling to  $\ell_R^-\ell_R^{\prime-}$  and  $\ell_L^+\ell_L^{\prime+}$  ("right-handed"). These Higgs bosons appear in some left-right symmetric models based on the gauge group  $\mathrm{SU}(2)_L \times \mathrm{SU}(2)_R \times \mathrm{U}(1)$ , the type-II seesaw model, and the Zee-Babu model. The two cases are listed separately in the following. Unless

noted, one of the lepton flavor combinations is assumed to be dominant in the decay.

Limits for  $H^{\pm\pm}$  with  $T_3=\pm1$

- <sup>1</sup> AAD 23AI search for  $H^{++}H^{--}$  production using 139 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=13$  TeV. Decay branching ratios B( $H^{++}\to\ell^+\ell'^+$ ) for the six flavor combinations are assumed to be equal, adding up to unity. If the T<sub>3</sub> = 0 states are degenerate with the T<sub>3</sub> =  $\pm 1$  states, the limit becomes 1080 GeV.
- <sup>2</sup>AABOUD 19K search for pair production of  $H^{++}H^{--}$  followed by the decay  $H^{\pm\pm}\to W^\pm W^\pm$  in 36.1 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=13$  TeV. The search is interpreted in a doublet-triplet extension of the scalar sector with a vev of 0.1 GeV, leading to B( $H^{\pm\pm}\to W^\pm W^\pm$ ) = 1. See their Fig. 5 for limits on the cross section for  $m_{H^{++}}$  between 200 and 700 GeV
- 3 See their Figs. 11(b) and 13 for limits with smaller branching ratios.
- <sup>4</sup>AAD 15AG search for  $H^{++}H^{--}$  production in 20.3 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=8$  TeV. The limit assumes 100% branching ratio to the specified final state. See their Fig. 5 for limits for arbitrary branching ratios.
- $^5$  AAD 15AP search for  $H^{++}H^{--}$  production in 20.3 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=8$  TeV. The limit assumes 100% branching ratio to the specified final state.
- <sup>6</sup> CHATRCHYAN 12AU search for  $H^{++}H^{--}$  production with 4.9 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=7$  TeV. The limit assumes 100% branching ratio to the specified final state. See their Table 6 for limits including associated  $H^{++}H^{-}$  production or assuming different scenarios.
- <sup>7</sup>ABDALLAH 03 search for  $H^{++}H^{--}$  pair production either followed by  $H^{++} \rightarrow \tau^+\tau^+$ , or decaying outside the detector.
- <sup>8</sup> ABBIENDI 02C searches for pair production of  $H^{++}H^{--}$ , with  $H^{\pm\pm}\to \ell^\pm\ell^\pm$  ( $\ell,\ell'=e,\mu,\tau$ ). The limit holds for  $\ell=\ell'=\tau$ , and becomes stronger for other combinations of leptonic final states. To ensure the decay within the detector, the limit only applies for  $g(H\ell\ell)\gtrsim 10^{-7}$ .
- 9 AAD 210 search for pair production of  $H^{++}H^{--}$  followed by the decay  $H^{\pm\pm}\to W^\pm W^\pm$  in 139 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=13$  TeV. The search is interpreted in a triplet extension of the SM Higgs sector with a triplet vev of 0.1 GeV, leading to  ${\rm B}(H^{\pm\pm}\to W^\pm W^\pm)=1$ . See their Fig. 9(a) for limits on the cross section for  $m_{H^{++}}$  between 200 and 600 GeV.
- 10 AAD 21U search for associated production of  $H^{\pm\pm}H^{\mp}$  followed by the decays  $H^{\pm\pm}\to W^{\pm}W^{\pm}$ ,  $H^{\pm}\to W^{\pm}Z$  in 139 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV.  $H^{\pm\pm}$  and  $H^{\pm}$  are assumed to be degenerate in mass within 5 GeV. The search is interpreted in a triplet extension of the SM Higgs sector with a triplet vev of 0.1 GeV, leading to B( $H^{\pm\pm}\to W^{\pm}W^{\pm}$ ) = 1. See their Fig. 9(b) for limits on the cross section for  $m_{H^{++}}$  between 200 and 600 GeV
- 200 and 600 GeV. 
  11 SIRUNYAN 21W search for vector boson fusion production of  $H^{\pm\pm}$  decaying to  $H^{\pm\pm}\to W^\pm W^\pm \to \ell^\pm \nu \ell^\pm \nu$  in 137 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 8 for limits on cross section times branching ratio for  $m_{H^{++}}=0.2$ –3.0 TeV.
- <sup>12</sup> SIRUNYAN 19CQ search for  $H^{\pm\pm}$  production by vector boson fusion followed by the decay  $H^{\pm\pm} \to W^{\pm}W^{\pm} \to qq\ell\nu$  in 35.9 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=13$  TeV. See their Fig. 5 for limits on cross section times branching ratio for  $m_{H^{\pm\pm}}$  between 0.6 and 2 TeV.
- 13 SIRUNYAN 18CC search for  $H^{\pm\pm}$  production by vector boson fusion followed by the decay  $H^{\pm\pm} \to W^\pm W^\pm$  in 35.9 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=13$  TeV. See their

- Fig. 3 for limits on cross section times branching ratio for  $m_{H^{\pm\pm}}$  between 200 and 1000 GeV
- GeV. 14 KANEMURA 15 examine the case where  $H^{++}$  decays preferentially to  $W^{(*)}$   $W^{(*)}$  and estimate that a lower mass limit of  $\sim$  84 GeV can be derived from the same-sign dilepton data of AAD 15AG if  $H^{++}$  decays with 100% branching ratio to  $W^{(*)}$   $W^{(*)}$ .
- $^{15}$  KHACHATRYAN  $^{15}$ D search for  $H^{\pm\pm}$  production by vector boson fusion followed by the decay  $H^{\pm\pm}\to~W^\pm\,W^\pm$  in  $^{19.4}$  fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=8$  TeV. See their Fig. 4 for limits on cross section times branching ratio for  $m_{H^{++}}$  between 160 and 800 GeV.
- <sup>16</sup> KANEMURA 14 examine the case where  $H^{++}$  decays preferentially to  $W^{(*)}W^{(*)}$  and estimate that a lower mass limit of  $\sim$  60 GeV can be derived from the same-sign dilepton data of AAD 12CY.
- $^{17}$  AAD 13Y search for  $H^{++}H^{--}$  production in a generic search of events with three charged leptons in 4.6 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=7$  TeV. The limit assumes 100% branching ratio to the specified final state.
- $^{18}$  AAD 12AY search for  $H^{++}H^{--}$  production with 1.6 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=7$  TeV. The limit assumes 100% branching ratio to the specified final state.
- $^{19}$  AAD 12CQ search for  $H^{++}H^{--}$  production with 4.7 fb $^{-1}$  of pp collisions at  $E_{\rm cm}=7$  TeV. The limit assumes 100% branching ratio to the specified final state. See their Table 1 for limits assuming smaller branching ratios.
- <sup>20</sup> ABAZOV 12A search for  $H^{++}H^{--}$  production in 7.0 fb<sup>-1</sup> of  $p\overline{p}$  collisions at  $E_{\rm cm}=1.96$  TeV.
- <sup>21</sup> AALTONEN 11AF search for  $H^{++}H^{--}$  production in 6.1 fb<sup>-1</sup> of  $p\overline{p}$  collisions at  $E_{\rm cm}=1.96$  TeV.
- <sup>22</sup> AALTONEN 08AA search for  $H^{++}H^{--}$  production in  $p\overline{p}$  collisions at  $E_{\rm cm}=1.96$  TeV. The limit assumes 100% branching ratio to the specified final state.
- <sup>23</sup> ABAZOV 08V search for  $H^{++}H^{--}$  production in  $p\overline{p}$  collisions at  $E_{\rm cm}=$  1.96 TeV. The limit is for B( $H\to \mu\mu$ ) = 1. The limit is updated in ABAZOV 12A.
- <sup>24</sup> AKTAS 06A search for single  $H^{\pm\pm}$  production in ep collisions at HERA. Assuming that  $H^{++}$  only couples to  $e^+\mu^+$  with  $g_{e\,\mu}=0.3$  (electromagnetic strength), a limit  $m_{H^{++}}>141$  GeV (95% CL) is derived. For the case where  $H^{++}$  couples to  $e\tau$  only the limit is 112 GeV.
- <sup>25</sup> ACOSTA 05L search for  $H^{++}H^{--}$  pair production in  $p\overline{p}$  collisions. The limit is valid for  $g_{\ell\ell'} < 10^{-8}$  so that the Higgs decays outside the detector.
- <sup>26</sup> ABAZOV 04E search for  $H^{++}H^{--}$  pair production in  $H^{\pm\pm}\to\mu^\pm\mu^\pm$ . The limit is valid for  $g_{\mu\mu}\gtrsim 10^{-7}$ .
- ABBIENDI 03Q searches for single  $H^{\pm\pm}$  via direct production in  $e^+e^- \rightarrow e^\mp e^\mp H^{\pm\pm}$ , and via t-channel exchange in  $e^+e^- \rightarrow e^+e^-$ . In the direct case, and assuming B( $H^{\pm\pm} \rightarrow \ell^\pm \ell^\pm$ ) = 1, a 95% CL limit on  $h_{ee}$  < 0.071 is set for  $m_{H^{\pm\pm}}$  < 160 GeV (see Fig. 6). In the second case, indirect limits on  $h_{ee}$  are set for  $m_{H^{\pm\pm}}$  < 2 TeV (see Fig. 8).
- $^{28}$  GORDEEV 97 search for muonium-antimuonium conversion and find  $G_{M\,\overline{M}}/G_F < 0.14$  (90% CL), where  $G_{M\,\overline{M}}$  is the lepton-flavor violating effective four-fermion coupling. This limit may be converted to  $m_{H^{++}} > 210$  GeV if the Yukawa couplings of  $H^{++}$  to ee and  $\mu\mu$  are as large as the weak gauge coupling. For similar limits on muonium-antimuonium conversion, see the muon Particle Listings.
- $^{29}$  ASAKA 95 point out that  $H^{++}$  decays dominantly to four fermions in a large region of parameter space where the limit of ACTON 92M from the search of dilepton modes does not apply.
- <sup>30</sup> ACTON 92M limit assumes  $H^{\pm\pm} \to \ell^{\pm}\ell^{\pm}$  or  $H^{\pm\pm}$  does not decay in the detector. Thus the region  $g_{\ell\ell} \approx 10^{-7}$  is not excluded.

 $^{31}$  ACTON 92M from  $\Delta\Gamma_Z$  <40 MeV.

 $^{32}\,\text{SWARTZ}$  90 assume  $H^{\pm\pm}\to \ell^\pm\ell^\pm$  (any flavor). The limits are valid for the Higgs-lepton coupling g(H\$\ell\$\ell\$)  $\gtrsim 7.4\times 10^{-7}/[m_H/\text{GeV}]^{1/2}$ . The limits improve somewhat for ee and  $\mu\mu$  decay modes.

## Limits for $H^{\pm\pm}$ with $T_3 = 0$

<sup>&</sup>lt;sup>1</sup> AAD 23AI search for  $H^{++}H^{--}$  production using 139 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=13$  TeV. Decay branching ratios B( $H^{++}\to\ell^+\ell'^+$ ) for the six flavor combinations are assumed to be equal, adding up to unity.

<sup>&</sup>lt;sup>2</sup> See their Figs. 12(b) and 14 for limits with smaller branching ratios.

<sup>&</sup>lt;sup>3</sup>AAD 15AG search for  $H^{++}H^{--}$  production in 20.3 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=8$  TeV. The limit assumes 100% branching ratio to the specified final state. See their Fig. 5 for limits for arbitrary branching ratios.

 $<sup>^4</sup>$  AAD 15AP search for  $H^{++}\,H^{--}$  production in 20.3 fb $^{-1}$  of  $p\,p$  collisions at  $E_{\rm cm}=8$  TeV. The limit assumes 100% branching ratio to the specified final state.

<sup>&</sup>lt;sup>5</sup> ABDALLAH 03 search for  $H^{++}H^{--}$  pair production either followed by  $H^{++} \to \tau^+ \tau^+$ , or decaying outside the detector.

<sup>&</sup>lt;sup>6</sup> ACHARD 03F search for  $e^+e^- \rightarrow H^{++}H^{--}$  with  $H^{\pm\pm} \rightarrow \ell^{\pm}\ell'^{\pm}$ . The limit holds for  $\ell=\ell'=\tau$ , and slightly different limits apply for other flavor combinations. The limit is valid for  $g_{\ell\ell'}\gtrsim 10^{-7}$ .

- <sup>7</sup> ABBIENDI 02C searches for pair production of  $H^{++}H^{--}$ , with  $H^{\pm\pm}\to\ell^{\pm}\ell^{\pm}(\ell,\ell')=e,\mu,\tau$ ). the limit holds for  $\ell=\ell'=\tau$ , and becomes stronger for other combinations of leptonic final states. To ensure the decay within the detector, the limit only applies for  $g(H\ell\ell)\gtrsim 10^{-7}$ .
- <sup>8</sup> AAD 12AY search for  $H^{++}H^{--}$  production with 1.6 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=7$  TeV. The limit assumes 100% branching ratio to the specified final state.
- <sup>9</sup> AAD 12CQ search for  $H^{++}H^{--}$  production with 4.7 fb<sup>-1</sup> of pp collisions at  $E_{\rm cm}=7$  TeV. The limit assumes 100% branching ratio to the specified final state. See their Table 1 for limits assuming smaller branching ratios.
- $^{10}$  ABAZOV 12A search for  $H^{++}H^{--}$  production in 7.0 fb $^{-1}$  of  $p\,\overline{p}$  collisions at  $E_{\rm cm}=1.96$  TeV.
- <sup>11</sup> AALTONEN 11AF search for  $H^{++}H^{--}$  production in 6.1 fb<sup>-1</sup> of  $p\overline{p}$  collisions at  $E_{\rm cm}$  = 1.96 TeV.
- $^{12}$  ABAZOV 08V search for  $H^{++}H^{--}$  production in  $p\overline{p}$  collisions at  $E_{\rm cm}=$  1.96 TeV. The limit is for B(H  $\rightarrow ~\mu\mu)=1$ . The limit is updated in ABAZOV 12A.
- $^{13}$  AKTAS 06A search for single  $H^{\pm\pm}$  production in ep collisions at HERA. Assuming that  $H^{++}$  only couples to  $e^+\mu^+$  with  $g_{e\,\mu}=0.3$  (electromagnetic strength), a limit  $m_{H^{++}}>141$  GeV (95% CL) is derived. For the case where  $H^{++}$  couples to  $e\tau$  only the limit is 112 GeV.
- $^{14}$  ACOSTA 05L search for  $H^{++}H^{--}$  pair production in  $p\overline{p}$  collisions. The limit is valid for  $g_{\ell\ell'} < 10^{-8}$  so that the Higgs decays outside the detector.
- <sup>15</sup> ABAZOV 04E search for  $H^{++}H^{--}$  pair production in  $H^{\pm\pm}\to\mu^\pm\mu^\pm$ . The limit is valid for  $g_{\mu\mu}\gtrsim 10^{-7}$ .
- <sup>16</sup> ABBIENDI 03Q searches for single  $H^{\pm\pm}$  via direct production in  $e^+e^- \rightarrow e^\mp e^\mp H^{\pm\pm}$ , and via t-channel exchange in  $e^+e^- \rightarrow e^+e^-$ . In the direct case, and assuming  ${\rm B}(H^{\pm\pm} \rightarrow \ell^\pm \ell^\pm) = 1$ , a 95% CL limit on  $h_{ee} < 0.071$  is set for  $m_{H^{\pm\pm}} < 160$  GeV (see Fig. 6). In the second case, indirect limits on  $h_{ee}$  are set for  $m_{H^{\pm\pm}} < 2$  TeV (see Fig. 8).
- $^{17}$  GORDEEV 97 search for muonium-antimuonium conversion and find  $G_{M\,\overline{M}}/G_F < 0.14$  (90% CL), where  $G_{M\,\overline{M}}$  is the lepton-flavor violating effective four-fermion coupling. This limit may be converted to  $m_{H^{++}} > 210$  GeV if the Yukawa couplings of  $H^{++}$  to ee and  $\mu\mu$  are as large as the weak gauge coupling. For similar limits on muonium-antimuonium conversion, see the muon Particle Listings.
- <sup>18</sup> ACTON 92M limit assumes  $H^{\pm\pm} \rightarrow \ell^{\pm}\ell^{\pm}$  or  $H^{\pm\pm}$  does not decay in the detector. Thus the region  $g_{\ell\ell} \approx 10^{-7}$  is not excluded.
- $^{19}\,\text{ACTON}$  92M from  $\Delta\Gamma_Z<$  40 MeV.
- $^{20}\,\text{SWARTZ}$  90 assume  $H^{\pm\pm}\to \ell^{\pm}\ell^{\pm}$  (any flavor). The limits are valid for the Higgs-lepton coupling g(H\$\ell\$\ell\$)  $\gtrsim 7.4\times 10^{-7}/[m_H/\text{GeV}]^{1/2}$ . The limits improve somewhat for ee and  $\mu\mu$  decay modes.
