### $\eta$ MASS

Recent measurements resolve the obvious inconsistency in previous  $\eta$  mass measurements in favor of the higher value first reported by NA48 (LAI 02). We use only precise measurements consistent with this higher mass value for our  $\eta$  mass average.

## CONSTRAINED FIT INFORMATION

An overall fit to 2 decay rate and 22 branching ratios uses 54 measurements and one constraint to determine 9 parameters. The overall fit has a  $\chi^2 = 46.2$  for 46 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

See the table immediately above giving the fitted decay rates. Following the advice of NEFKENS 02, we have removed the Primakoff-effect measurement from the average. See also the “Note on the Decay Width  $\Gamma(\eta \rightarrow \gamma\gamma)$ ,” in our 1994 edition, Phys. Rev. D**50**, 1 August 1994, Part I, p. 1451, for a discussion of the various measurements.

$1.00 \pm 0.22$	<sup>2</sup> BEMPORAD 67	CNTR	Primakoff effect

<sup>1</sup> RODRIGUES 08 uses a more sophisticated calculation for the inelastic background due to incoherent photoproduction to reanalyze the  $\eta$  photoproduction data on Be and Cu at 9 GeV from BROWMAN 74B. This brings the value of  $\Gamma(\eta \rightarrow 2\gamma)$  in line with direct measurements of the width. The error here is only statistical.

<sup>2</sup> BEMPORAD 67 gives  $\Gamma(2\gamma) = 1.21 \pm 0.26$  keV assuming  $\Gamma(2\gamma)/\Gamma(\text{total}) = 0.314$ . Bemporad private communication gives  $\Gamma(2\gamma)^2/\Gamma(\text{total}) = 0.380 \pm 0.083$ . We evaluate this using  $\Gamma(2\gamma)/\Gamma(\text{total}) = 0.38 \pm 0.01$ . Not included in average because the uncertainty resulting from the separation of the coulomb and nuclear amplitudes has apparently been underestimated.

## $\eta$ CP-NONCONSERVING DECAY PARAMETER

### $\pi^+ \pi^- e^+ e^-$ DECAY-PLANE ASYMMETRY PARAMETER $A_\phi$

In the  $\eta$  rest frame, the total momentum of the  $e^+ e^-$  pair is equal and opposite to that of the  $\pi^+ \pi^-$  pair. Let  $\hat{z}$  be the unit vector along the momentum of the  $e^+ e^-$  pair; let  $\hat{n}_{ee}$  and  $\hat{n}_{\pi\pi}$  be the unit vectors normal to the  $e^+ e^-$  and  $\pi^+ \pi^-$  planes; and let  $\phi$  be the angle between the two normals. Then

$$\sin\phi \cos\phi = [(\hat{n}_{ee} \times \hat{n}_{\pi\pi}) \cdot \hat{z}] (\hat{n}_{ee} \cdot \hat{n}_{\pi\pi}),$$

and

$$A_\phi \equiv \frac{N_{\sin\phi \cos\phi > 0} - N_{\sin\phi \cos\phi < 0}}{N_{\sin\phi \cos\phi > 0} + N_{\sin\phi \cos\phi < 0}}.$$

## PARAMETER $\Lambda$ IN $\eta \rightarrow \ell^+ \ell^- \gamma$ DECAY

In the pole approximation the electromagnetic transition form factor for a resonance of mass  $M$  is given by the expression:

$$|F|^2 = (1 - M_{\ell\ell}^2/\Lambda^2)^{-2},$$

where for the parameter  $\Lambda$  vector dominance predicts  $\Lambda \approx 0.770$  GeV.
