 $^{^2}$ DIAZCRUZ 94 limits are from $\Gamma(au o e
u
u)$ and assume flavor-dependent contact interactions with $\Lambda(\tau \nu_{\tau} e \nu_{\rho}) \ll \Lambda(\mu \nu_{\mu} e \nu_{\rho})$.

 $^{^3}$ DIAZCRUZ 94 limits are from $\Gamma(au o \mu
u
u)$ and assume flavor-dependent contact interactions with $\Lambda(\tau \nu_{\tau} \mu \nu_{\mu}) \ll \Lambda(\mu \nu_{\mu} e \nu_{e})$.

¹ AABOUD 17AK limit is from dijet angular distribution in pp collisions at $\sqrt{s} = 13$ TeV. u, d, and s quarks are assumed to be composite.

 $^{^2}$ AABOUD 18AV obtain limit on t_R compositeness $2\pi/\Lambda_{RR}^2<1.6~{\rm TeV}^{-2}$ at 95% CL from $t\overline{t}\,t\overline{t}$ production in the pp collisions at $E_{\rm cm}=13~{\rm TeV}.$

 $^{^3}$ SIRUNYAN 18DD limit is from dijet angular distribution in pp collisions at $\sqrt{s}=13$ TeV.

 $^{^4}$ SIRUNYAN 17F limit is from dijet angular cross sections in pp collisions at $E_{\rm cm}=13$ TeV. All quarks are assumed to be composite.

- ⁵ AAD 16S limit is from dijet angular selections in pp collisions at $E_{\rm cm}=13$ TeV. u,d, and s quarks are assumed to be composite.
- 6 AAD 15AR obtain limit on the t_R compositeness $2\pi/\Lambda_{RR}^2 < 6.6~{\rm TeV}^{-2}$ at 95% CL from the $t\overline{t}\,t\overline{t}$ production in the $p\,p$ collisions at $E_{\rm cm}=8~{\rm TeV}.$
- 7 AAD 15BY obtain limit on the t_R compositeness $2\pi/\Lambda_{RR}^2 < 15.1~{\rm TeV}^{-2}$ at 95% CL from the $t\overline{t}$ tr \overline{t} production in the pp collisions at $E_{\rm cm}=8~{\rm TeV}.$
- ⁸ AAD 15L limit is from dijet angular distribution in pp collisions at $E_{\rm cm}=8$ TeV. u,d, and s quarks are assumed to be composite.
- $^9\,\rm KHACHATRYAN$ 15J limit is from dijet angular distribution in pp collisions at $E_{\rm cm}=8$ TeV. u,~d,~s,~c, and b quarks are assumed to be composite.
- ¹⁰ FABBRICHESI 14 obtain bounds on chromoelectric and chromomagnetic form factors of the top-quark using $pp \to t\bar{t}$ and $p\bar{p} \to t\bar{t}$ cross sections. The quoted limit on the $q\bar{q}t\bar{t}$ contact interaction is derived from their bound on the chromoelectric form factor.

SCALE LIMITS for Contact Interactions: $\Lambda(\nu\nu qq)$

Limits are for Λ_{II}^{\pm} only. For other cases, see each reference.

MASS LIMITS for Excited e (e*)

Most e^+e^- experiments assume one-photon or Z exchange. The limits from some e^+e^- experiments which depend on λ have assumed transition couplings which are chirality violating $(\eta_L=\eta_R)$. However they can be interpreted as limits for chirality-conserving interactions after multiplying the coupling value λ by $\sqrt{2}$; see Note.

Excited leptons have the same quantum numbers as other ortholeptons. See also the searches for ortholeptons in the "Searches for Heavy Leptons" section.

Limits for Excited e (e*) from Pair Production

These limits are obtained from $e^+e^- \to e^{*+}e^{*-}$ and thus rely only on the (electroweak) charge of e^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the e^* coupling is assumed to be of sequential type. Possible t channel contribution from transition magnetic coupling is neglected. All limits assume a dominant $e^* \to e\gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review D45 S1 (1992)).

 $^{^{1}\,\}mathrm{MCFARLAND}$ 98 assumed a flavor universal interaction. Neutrinos were mostly of muon type.

¹ From e^+e^- collisions at $\sqrt{s}=183-209$ GeV. f=f' is assumed.

² From e⁺e⁻ collisions at $\sqrt{s}=189$ –209 GeV. f=f' is assumed. ACHARD 03B also obtain limit for f=-f': $m_{e^*}>96.6$ GeV.

Limits for Excited $e(e^*)$ from Single Production

These limits are from $e^+e^- \to e^*e$, $W \to e^*\nu$, or $ep \to e^*X$ and depend on transition magnetic coupling between e and e^* . All limits assume $e^* \to e\gamma$ decay except as noted. Limits from LEP, UA2, and H1 are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the $\lambda - m_{e^*}$ plane. See the original papers.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

- ¹ SIRUNYAN 20AJ search for e* production in 2e2j final states in pp collisions at $\sqrt{s}=13$ TeV. The quoted limit assumes $\Lambda=m_{e^*},\ f=f'=1$. The contact interaction is included. See their Fig.11 for exclusion limits in m_{e^*} - Λ plane.
- ² AABOUD 19AZ search for single e^* production in pp collisions at $\sqrt{s}=13$ TeV. The limit quoted above is from $e^* \to e \, q \, \overline{q}$ and $e^* \to \nu \, W$ decays assuming f=f'=1 and $m_{e^*}=\Lambda$. The contact interaction is included in e^* production and decay amplitudes. See their Fig.6 for exclusion limits in $m_{e^*}-\Lambda$ plane.
- ³ SIRUNYAN 19Z search for e^* production in $\ell\ell\gamma$ final states in pp collisions at $\sqrt{s}=13$ TeV. The quoted limit assumes $\Lambda=m_{e^*}$, f=f'=1. The contact interaction is included in the e^* production and decay amplitudes.
- ⁴ KHACHATRYAN 16AQ search for single e^* production in pp collisions at $\sqrt{s}=8$ TeV. The limit above is from the $e^* \to e\gamma$ search channel assuming f=f'=1, $m_{e^*}=\Lambda$. See their Table 7 for limits in other search channels or with different assumptions.
- ⁵ AAD 15AP search for e^* production in evens with three or more charged leptons in pp collisions at $\sqrt{s}=8$ TeV. The quoted limit assumes $\Lambda=m_{e^*}$, f=f'=1. The contact interaction is included in the e^* production and decay amplitudes.
- ⁶ AAD 13BB search for single e^* production in pp collisions with $e^* \to e\gamma$ decay. f = f' = 1, and e^* production via contact interaction with $\Lambda = m_{a^*}$ are assumed.
- ⁷ CHATRCHYAN 13AE search for single e^* production in pp collisions with $e^* \to e\gamma$ decay. f = f' = 1, and e^* production via contact interaction with $\Lambda = m_{e^*}$ are assumed.
- ⁸ AAD 12AZ search for e^* production via four-fermion contact interaction in pp collisions with $e^* \to e\gamma$ decay. The quoted limit assumes $\Lambda = m_{e^*}$. See their Fig. 8 for the exclusion plot in the mass-coupling plane.

Limits for Excited $e(e^*)$ from $e^+e^- \rightarrow \gamma\gamma$

These limits are derived from indirect effects due to e^* exchange in the t channel and depend on transition magnetic coupling between e and e^* . All limits are for $\lambda_{\gamma}=1$. All limits except ABE 89J and ACHARD 02D are for nonchiral coupling with $\eta_L=\eta_R=1$. We choose the chiral coupling limit as the best limit and list it in the Summary Table.

For limits prior to 1987, see our 1992 edition (Physical Review D45 S1 (1992)).

MASS LIMITS for Excited μ (μ *)

Limits for Excited μ (μ *) from Pair Production

These limits are obtained from $e^+e^- \to \mu^{*+}\mu^{*-}$ and thus rely only on the (electroweak) charge of μ^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the μ^* coupling is assumed to be of sequential type. All limits assume a dominant $\mu^* \to \mu \gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review D45 S1 (1992)).

¹ From e^+e^- collisions at $\sqrt{s}=183$ –209 GeV. f=f' is assumed.

 $^{^1}$ DORENBOSCH 89 obtain the limit $\lambda_{\gamma}^2\Lambda_{\rm cut}^2/m_{e^*}^2<2.6$ (95% CL), where $\Lambda_{\rm cut}$ is the cutoff scale, based on the one-loop calculation by GRIFOLS 86. If one assumes that $\Lambda_{\rm cut}=1$ TeV and $\lambda_{\gamma}=1$, one obtains $m_{e^*}>620$ GeV. However, one generally expects $\lambda_{\gamma}\approx m_{e^*}/\Lambda_{\rm cut}$ in composite models.

 $^{^2}$ GRIFOLS 86 uses $\nu_{\mu}\,e \to \ \nu_{\mu}\,e$ and $\overline{\nu}_{\mu}\,e \to \ \overline{\nu}_{\mu}\,e$ data from CHARM Collaboration to derive mass limits which depend on the scale of compositeness.

 $^{^3}$ RENARD 82 derived from g-2 data limits on mass and couplings of e^* and μ^* . See figures 2 and 3 of the paper.

 $^{^2}$ From e^+e^- collisions at $\sqrt{s}=$ 189–209 GeV. f=f' is assumed. ACHARD 03B also obtain limit for $f=-f'\colon m_{\mu^*}>$ 96.6 GeV.

Limits for Excited μ (μ *) from Single Production

These limits are from $e^+e^- \to \mu^*\mu$ and depend on transition magnetic coupling between μ and μ^* . All limits assume $\mu^* \to \mu\gamma$ decay. Limits from LEP are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the $\lambda - m_{\mu^*}$ plane. See the original papers.

For limits prior to 1987, see our 1992 edition (Physical Review D45 S1 (1992)).

¹ TUMASYAN 23AF limit quoted above assumes $bg \rightarrow b^*$ production. The limit becomes $m_{b*} > 4 \text{ TeV}$ if contact interaction is included in the b^* production cross section. See their Fig. 5 for limits on $\sigma \cdot B$.

²TUMASYAN 23BC search for excited light flavor quark q^* in pp collisions at $\sqrt{s}=13$ TeV. f = 1.0 is assumed.

 $^{^3}$ TUMASYAN 23BC search for excited b quark b^* in pp collisions at $\sqrt{s}=13$ TeV. b^* production via gauge interactions and f=1.0 are assumed. The limit becomes $m_{b^*} > 3.8 \text{TeV}$ if contact interaction is included in the b^* production cross section.

⁴ AAD 20T search for resonances decaying into dijets in pp collisions at $\sqrt{s}=13$ TeV. Assume $\Lambda = m_{q^*}$, $f_s = f = f' = 1$.

 $^{^5}$ SIRUNYAN 20AI search for resonances decaying into dijets in pp collisions at $\sqrt{s}=13$ TeV. Assume $\Lambda=m_{q^*}$, $f_S=f=f'=1$.

 $^{^6}$ AABOUD 18AB assume $\Lambda=m_{h^*}$, $f_{\rm S}=f=f'=1$. The contact interactions are not included in b^* production and decay amplitudes.

 $^{^7}$ AABOUD 18BA search for first-generation excited quarks (u^* and d^*) with degenerate mass, assuming $\Lambda=m_{\sigma^*}$, $f_{\rm S}=f=f'=1$. The contact interactions are not included in q^* production and decay amplitudes.

 $^{^8}$ SIRUNYAN 18AG search for first-generation excited quarks $(u^*$ and d^*) with degenerate mass, assuming $\Lambda=m_{q^*}$, $f_{\rm S}=f=f'=1$.

 $^{^9}$ SIRUNYAN 18AG search for excited b quark assuming $\Lambda=m_{m{q}^*}$, $f_{m{s}}=f=f'=1$.

- 10 SIRUNYAN 18BO assume $\Lambda=m_{q^*}$, $f_s=f=f'=1$. The contact interactions are not included in q^* production and decay amplitudes.
- 11 SIRUNYAN 18P use the hadronic decay of W or Z , assuming $\varLambda=m_{q^*}$, $f_{\rm S}=f=f'=1.$
- ¹² AABOUD 17AK assume $\Lambda=m_{q^*}$, $f_s=f=f'=1$. The contact interactions are not included in q^* production and decay amplitudes. Only the decay of $q^*\to g\,u$ and $q^*\to g\,d$ is simulated as the benchmark signals in the analysis.
- TUMASYAN 220 search for b^* decaying to tW in pp collisions at $\sqrt{s}=13$ TeV. The limit quoted above assumes $\kappa_L^b=g_L=1,\ \kappa_R^b=g_R=0.$ The limit becomes $m_{b^*}>3.0$ TeV (>3.2 TeV) if we assume $\kappa_L^b=g_L=0,\ \kappa_R^b=g_R=1$ ($\kappa_L^b=g_L=1,\ \kappa_R^b=g_R=1$). See their Fig. 3 for limits on $\sigma\cdot B$.
- ¹⁴ SIRUNYAN 21AG search for b^* decaying to tW in pp collisions at $\sqrt{s}=13$ TeV. The limit quoted above assumes $\kappa_L^b=g_L=1$, $\kappa_R^b=g_R=0$. The limit becomes $m_{b^*}>2.8$ TeV (> 3.1 TeV) if we assume $\kappa_L^b=g_L=0$, $\kappa_R^b=g_R=1$ ($\kappa_L^b=g_L=\kappa_R^b=g_R=1$). See their Fig. 5 for limits on $\sigma \cdot B$.
- ¹⁵ KHACHATRYAN 17W assume $\Lambda=m_{q^*}$, $f_s=f=f'=1$. The contact interactions are not included in q^* production and decay amplitudes.
- ¹⁶ AABOUD 16 assume $\Lambda = m_{b^*}$, $f_s = f = f' = 1$. The contact interactions are not included in the b^* production and decay amplitudes.
- ¹⁷ AAD 16AH search for b^* decaying to tW in pp collisions at $\sqrt{s}=8$ TeV. $f_g=f_L=f_R=1$ are assumed. See their Fig. 12b for limits on $\sigma \cdot B$.
- ¹⁸ AAD 16AI assume $\Lambda = m_{\sigma^*}$, $f_s = f = f' = 1$.
- 19 AAD 16AV search for single production of vector-like quarks decaying to Wb in pp collisions. See their Fig. 8 for the limits on couplings and mixings.
- ²⁰ AAD 16S assume $\Lambda = m_{q^*}$, $f_S = f = f' = 1$. The contact interactions are not included in q^* production and decay amplitudes.
- ²¹ KHACHATRYAN 16I search for b^* decaying to tW in pp collisions at $\sqrt{s}=8$ TeV. $\kappa_L^b=g_L=1,\ \kappa_R^b=g_R=0$ are assumed. See their Fig. 8 for limits on $\sigma\cdot B$.
- ²² KHACHATRYAN 16K assume $\Lambda=m_{q^*}$, $f_s=f=f'=1$. The contact interactions are not included in q^* production and decay amplitudes.
- ²³ KHACHATRYAN 16L search for resonances decaying to dijets in pp collisions at $\sqrt{s}=8$ TeV using the data scouting technique which increases the sensitivity to the low mass resonances.
- ²⁴ AAD 15V assume $\Lambda = m_{q^*}$, $f_s = f = f' = 1$. The contact interactions are not included in q^* production and decay amplitudes.
- ²⁵ KHACHATRYAN 15V assume $\Lambda=m_{q^*}$, $f_s=f=f'=1$. The contact interactions are not included in q^* production and decay amplitudes.
- ²⁶ AAD 14A assume $\Lambda=m_{q^*}$, $f_{\rm S}=f=f'=1$.
- ²⁷ KHACHATRYAN 14 use the hadronic decay of W, assuming $\Lambda = m_{a^*}$, $f_s = f = f' = 1$.
- $^{28}\, \rm KHACHATRYAN$ 14 use the hadronic decay of Z, assuming $\Lambda = m_{q^*}^{},\, f_S = f = f' = 1.$
- 29 KHACHATRYAN 14J assume $f_{\rm S}=f=f'=\Lambda\ /\ m_{\sigma^*}$.
- 30 CHATRCHYAN 13AJ use the hadronic decay of W.
- 31 CHATRCHYAN 13AJ use the hadronic decay of Z.

MASS LIMITS for Color Sextet Quarks (q_6)

VALUE (GeV)	CL%	DOCUMENT ID		TECN	COMMENT
>84	95	¹ ABE	89D	CDF	$p\overline{p} \rightarrow q_6\overline{q}_6$

 $^{^{}m 1}$ ABE 89D look for pair production of unit-charged particles which leave the detector before decaying. In the above limit the color sextet quark is assumed to fragment into a unit-charged or neutral hadron with equal probability and to have long enough lifetime not to decay within the detector. A limit of 121 GeV is obtained for a color decuplet.

 $^{^{}m 1}$ BARGER 89 used ABE 89B limit for events with large missing transverse momentum. Two-body decay $\nu_{\rm R}
ightarrow \, \nu_{\rm g}$ is assumed.

MASS LIMITS for W₈ (Color Octet W Boson)

TECN COMMENT DOCUMENT ID VALUE (GeV)

• • • We do not use the following data for averages, fits, limits, etc. • •

1
 ALBAJAR 89 UA1 $p\overline{p}
ightarrow W_{8}$ X, $W_{8}
ightarrow W_{g}$

Created: 4/29/2024 18:59

 1 ALBAJAR 89 give $\sigma(W_8 \to~W+{
m jet})/\sigma(W) <$ 0.019 (90% CL) for $m_{W_8}~>$ 220 GeV.

 $^{^{}m 1}$ ABE 89D look for pair production of unit-charged particles which leave the detector before decaying. In the above limit the color octet lepton is assumed to fragment into a unit-charged or neutral hadron with equal probability and to have long enough lifetime not to decay within the detector. The limit improves to 99 GeV if it always fragments into a unit-charged hadron.

 $^{^2}$ ABT 93 search for e_8 production via e-gluon fusion in ep collisions with $e_8 \to eg$. See their Fig. 3 for exclusion plot in the m_{e_8} -A plane for $m_{e_8}=$ 35–220 GeV.

 $^{^2}$ KIM 90 is at $E_{
m cm}=$ 50–60.8 GeV. The same assumptions as in BARTEL 87B are used.

 $^{^3}$ BARTEL 87B is at $E_{\rm cm}=46.3$ –46.78 GeV. The limit assumes the ν_8 pair production cross section to be eight times larger than that of the corresponding heavy neutrino pair production. This assumption is not valid in general for the weak couplings, and the limit can be sensitive to its $SU(2)_I \times U(1)_Y$ quantum numbers.
