See the Particle Listings for a Note “Neutrino Mass” giving details of neutrinos, masses, mixing, and the status of experimental searches.

There is now rather convincing evidence that neutrinos have nonzero mass from the apparent observation of neutrino oscillations, where the neutrinos come from  $\pi$  (or  $K$ )  $\rightarrow \mu \rightarrow e$  decays in the atmosphere; the mesons are produced in cosmic-ray cascades.

Detectors using gallium ( $E_\nu \gtrsim 0.2$  MeV), chlorine ( $E_\nu \gtrsim 0.8$  MeV), and Čerenkov effect in water ( $E_\nu \gtrsim 7$  MeV) measure significantly lower neutrino rates than are predicted from solar models. The deficit in the solar neutrino flux compared with solar model calculations could be explained by oscillations with  $\Delta m^2 \leq 10^{-5}$  eV<sup>2</sup> causing the disappearance of  $\nu_e$ .

## Atmospheric Neutrinos

Underground detectors observing neutrinos produced by cosmic rays in the atmosphere have measured a  $\nu_\mu/\nu_e$  ratio much less than expected and also a deficiency of upward going  $\nu_\mu$  compared to downward. This could be explained by oscillations leading to the disappearance of  $\nu_\mu$  with  $\Delta m^2 \approx 10^{-3}$  to  $0.1 \text{ eV}^2$ . This is presently the best evidence for neutrino mass.

### $\nu$ oscillation: $\nu_e \not\rightarrow \nu_e$ ( $\theta$ = mixing angle)

### $\nu$ oscillation: $\nu_\mu (\bar{\nu}_\mu) \rightarrow \nu_e (\bar{\nu}_e)$ (any combination)

## NOTES

- [a] This is the best “electron disappearance” limit. The best limit for the mode  $e^- \rightarrow \nu\gamma$  is  $> 2.35 \times 10^{25} \text{ yr}$  (CL=68%).
- [b] See the “Note on Muon Decay Parameters” in the  $\mu$  Particle Listings for definitions and details.
- [c]  $P_\mu$  is the longitudinal polarization of the muon from pion decay. In standard  $V-A$  theory,  $P_\mu = 1$  and  $\rho = \delta = 3/4$ .
- [d] This only includes events with the  $\gamma$  energy  $> 10 \text{ MeV}$ . Since the  $e^- \bar{\nu}_e \nu_\mu$  and  $e^- \bar{\nu}_e \nu_\mu \gamma$  modes cannot be clearly separated, we regard the latter mode as a subset of the former.
- [e] See the relevant Particle Listings for the energy limits used in this measurement.
- [f] A test of additive vs. multiplicative lepton family number conservation.
- [g] Basis mode for the  $\tau$ .
- [h]  $L^\pm$  mass limit depends on decay assumptions; see the Full Listings.
- [i] Assumes  $\nu_2$  is the dominant mass eigenstate.
- [j] Assumes  $\nu_3$  is the dominant mass eigenstate.
