\[ \pi^\pm \rightarrow \ell^\pm \nu \gamma \text{ AND } K^\pm \rightarrow \ell^\pm \nu \gamma \text{ FORM FACTORS} \]

Written by H.S. Pruys (Zürich University).

In the radiative decays \( \pi^\pm \rightarrow \ell^\pm \nu \gamma \) and \( K^\pm \rightarrow \ell^\pm \nu \gamma \), where \( \ell \) is an \( e \) or a \( \mu \) and \( \gamma \) is a real or virtual photon (\( e^+e^- \) pair), both the vector and the axial-vector weak hadronic currents contribute to the decay amplitude. Each current gives a structure-dependent term (SD\( _V \) and SD\( _A \)) from virtual hadronic states, and the axial-vector current also gives a contribution from inner bremsstrahlung (IB) from the lepton and meson. The IB amplitudes are determined by the meson decay constants \( f_\pi \) and \( f_K \) [1]. The SD\( _V \) and SD\( _A \) amplitudes are parameterized in terms of the vector form factor \( F_V \) and the axial-vector form factors \( F_A \) and \( R \) [1–4]:

\[
M(\text{SD}_V) = \frac{-eG_F V_q q'}{\sqrt{2} m_P} \epsilon^\mu \epsilon'^\nu F_V \epsilon_{\mu\nu\sigma\tau} k^\sigma q^\tau,
\]

\[
M(\text{SD}_A) = \frac{-ieG_F V_q q'}{\sqrt{2} m_P} \epsilon^\mu \epsilon'^\nu \left\{ F_A \left[ (s-t)g_{\mu\nu} - q_\mu k_\nu \right] + R t g_{\mu\nu} \right\}.
\]

(1)

Here \( V_{qq'} \) is the Cabibbo-Kobayashi-Maskawa mixing-matrix element; \( \epsilon^\mu \) is the polarization vector of the photon (or the effective vertex, \( \epsilon^\mu = (e/t)\pi(p_-)\gamma^\mu v(p_+) \), of the \( e^+e^- \) pair); \( \epsilon'^\nu = \pi(p_\nu)\gamma^\nu(1-\gamma_5)v(p_\nu) \) is the lepton-neutrino current; \( q \) and \( k \) are the meson and photon four-momenta, with \( s = q \cdot k \) and \( t = k^2 = (p_+ + p_-)^2 \); and \( P \) stands for \( \pi \) or \( K \). In the analysis of data, the \( s \) and \( t \) dependence of the form factors is neglected, which is a good approximation for pions [2] but not for kaons [4]. The pion vector form factor \( F_V^\pi \) is related via CVC to the \( \pi^0 \) lifetime, \( |F_V^\pi| = (1/\alpha)\sqrt{2\Gamma_{\pi^0}/m_{\pi^0}} \) [1]. PCAC relates \( R \) to the electromagnetic radius of the meson [2,4], \( R^P = \frac{1}{\gamma} m_P f_P \gamma P^2 \). The calculation of the other form factors, \( F_A^\pi \), \( F_V^K \), and \( F_A^K \), is model dependent [1,4].

When the photon is real, the partial decay rate can be given analytically [1,5]:

\[
\frac{d^2 \Gamma_{\ell^\pm \nu \gamma}}{dxdy} = \frac{d^2 \left( \Gamma_{\text{IB}} + \Gamma_{\text{SD}} + \Gamma_{\text{INT}} \right)}{dxdy},
\]

(2)
where $\Gamma_{IB}, \Gamma_{SD}$, and $\Gamma_{INT}$ are the contributions from inner bremsstrahlung, structure-dependent radiation, and their interference, and the $\Gamma_{SD}$ term is given by

$$\frac{d^2\Gamma_{SD}}{dx dy} = \frac{\alpha}{8\pi} \frac{1}{r(1-r)^2} \left(\frac{m_P}{f_P}\right)^2 \times \left[(F_V + F_A)^2 \text{SD}^+ + (F_V - F_A)^2 \text{SD}^-\right]. \quad (3)$$

Here

$$\text{SD}^+ = (x + y - 1 - r) [(x + y - 1)(1 - x) - r],$$

$$\text{SD}^- = (1 - y + r) [(1 - x)(1 - y) + r], \quad (4)$$

where $x = 2E_\gamma/m_P$, $y = 2E_\ell/m_P$, and $r = (m_\ell/m_P)^2$.

In $\pi^\pm \to e^\pm \nu_\gamma$ and $K^\pm \to e^\pm \nu_\gamma$ decays, the interference terms are small, and thus only the absolute values $|F_A + F_V|$ and $|F_A - F_V|$ can be obtained. In $K^\pm \to \mu^\pm \nu_\gamma$ decay, the interference term is important, and thus the signs of $F_V$ and $F_A$ can be obtained. In $\pi^\pm \to \mu^\pm \nu_\gamma$ decay, bremsstrahlung completely dominates. In $\pi^\pm \to e^\pm \nu e^\mp e^\mp$ and $K^\pm \to \ell^\pm \nu e^\mp e^\mp$ decays, all three form factors, $F_V$, $F_A$, and $R$, can be determined.

We give the $\pi^\pm$ form factors $F_V$, $F_A$, and $R$ in the Listings below. In the $K^\pm$ Listings, we give the sum $F_A + F_V$ and difference $F_A - F_V$.

The electroweak decays of the pseudoscalar mesons are investigated to learn something about the unknown hadronic structure of these mesons, assuming a standard $V - A$ structure of the weak leptonic current. The experiments are quite difficult, and it is not meaningful to analyse the results using parameters for both the hadronic structure (decay constants, form factors) and the leptonic weak current (e.g., to add pseudoscalar or tensor couplings to the $V - A$ coupling). Deviations from the $V - A$ interactions are much better studied in purely leptonic systems such as muon decay.
