

N BARYONS

($S = 0, I = 1/2$)

$p, N^+ = uud; n, N^0 = udd$

p

$$I(J^P) = \frac{1}{2}(\frac{1}{2}^+)$$

Mass $m = 1.00727646688 \pm 0.00000000013$ u

Mass $m = 938.27203 \pm 0.00008$ MeV [a]

$|m_p - m_{\bar{p}}|/m_p < 1.0 \times 10^{-8}$, CL = 90% [b]

$|\frac{q_p}{m_p}| / (\frac{q_{\bar{p}}}{m_{\bar{p}}}) = 0.9999999991 \pm 0.0000000009$

$|q_p + q_{\bar{p}}|/e < 1.0 \times 10^{-8}$, CL = 90% [b]

$|q_p + q_e|/e < 1.0 \times 10^{-21}$ [c]

Magnetic moment $\mu = 2.792847351 \pm 0.000000028$ μ_N

$(\mu_p + \mu_{\bar{p}}) / \mu_p = (-2.6 \pm 2.9) \times 10^{-3}$

Electric dipole moment $d < 0.54 \times 10^{-23}$ e cm

Electric polarizability $\alpha = (12.0 \pm 0.6) \times 10^{-4}$ fm³

Magnetic polarizability $\beta = (1.9 \pm 0.5) \times 10^{-4}$ fm³

Charge radius = 0.875 ± 0.007 fm

Mean life $\tau > 2.1 \times 10^{29}$ years, CL = 90% ($p \rightarrow$ invisible mode)

Mean life $\tau > 10^{31}$ to 10^{33} years [d] (mode dependent)

See the "Note on Nucleon Decay" in our 1994 edition (Phys. Rev. **D50**, 1673) for a short review.

The "partial mean life" limits tabulated here are the limits on τ/B_i , where τ is the total mean life and B_i is the branching fraction for the mode in question. For N decays, p and n indicate proton and neutron partial lifetimes.

p DECAY MODES	Partial mean life (10^{30} years)	Confidence level	<i>p</i> (MeV/c)

$[\alpha(\Lambda_c^+) + \alpha(\bar{\Lambda}_c^-)] / [\alpha(\Lambda_c^+) - \alpha(\bar{\Lambda}_c^-)]$ in $\Lambda_c^+ \rightarrow \Lambda e^+\nu_e, \bar{\Lambda}_c^- \rightarrow \bar{\Lambda}e^-\bar{\nu}_e$	0.00 ± 0.04

Nearly all branching fractions of the Λ_c^+ are measured relative to the $pK^-\pi^+$ mode, but there are no model-independent measurements of this branching fraction. We explain how we arrive at our value of $B(\Lambda_c^+ \rightarrow pK^-\pi^+)$ in a Note at the beginning of the branching-ratio measurements in the Listings. When this branching fraction is eventually well determined, all the other branching fractions will slide up or down proportionally as the true value differs from the value we use here.

 $\Lambda_c(2593)^+$

$I(J^P) = 0(\frac{1}{2}^-)$

The spin-parity follows from the fact that $\Sigma_c(2455)\pi$ decays, with little available phase space, are dominant. This assumes that $J^P = 1/2^+$ for the $\Sigma_c(2455)$.

Mass $m = 2595.4 \pm 0.6$ MeV (S = 1.1) $m - m_{\Lambda_c^+} = 308.9 \pm 0.6$ MeV (S = 1.1)Full width $\Gamma = 3.6^{+2.0}_{-1.3}$ MeV

$\Lambda_c^+ \pi \pi$ and its submode $\Sigma_c(2455)\pi$ — the latter just barely — are the only strong decays allowed to an excited Λ_c^+ having this mass; and the submode seems to dominate.

$\Lambda_c(2593)^+$ DECAY MODES	Fraction (Γ_i/Γ)	p (MeV/c)
$\Lambda_c^+ \pi^+ \pi^-$	[q] \approx 67 %	124
$\Sigma_c(2455)^{++} \pi^-$	24 \pm 7 %	28
$\Sigma_c(2455)^0 \pi^+$	24 \pm 7 %	28

$\Sigma^+ K^- K^- \pi^+$	seen	691
$\Xi^0 K^- \pi^+$	seen	903
$\Xi^- K^- \pi^+ \pi^+$	seen	832
$\Omega^- e^+ \nu_e$	seen	830
$\Omega^- \pi^+$	seen	822
$\Omega^- \pi^+ \pi^0$	seen	798
$\Omega^- \pi^- \pi^+ \pi^+$	seen	754

BOTTOM BARYONS ($B = -1$)

$$\Lambda_b^0 = u d b, \Xi_b^0 = u s b, \Xi_b^- = d s b$$

Λ_b^0

$$I(J^P) = 0(\frac{1}{2}^+)$$

$I(J^P)$ not yet measured; $0(\frac{1}{2}^+)$ is the quark model prediction.

Mass $m = 5624 \pm 9$ MeV ($S = 1.8$)

Mean life $\tau = (1.230 \pm 0.074) \times 10^{-12}$ s

$$c\tau = 369 \mu\text{m}$$

These branching fractions are actually an average over weakly decaying b -baryons weighted by their production rates in Z decay (or high-energy $p\bar{p}$), branching ratios, and detection efficiencies. They scale with the LEP b -baryon production fraction $B(b \rightarrow b\text{-baryon})$ and are evaluated for our value $B(b \rightarrow b\text{-baryon}) = (10.0 \pm 2.0)\%$.

The branching fractions $B(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{anything})$ and $B(\Lambda_b^0 \rightarrow \Lambda_c^+ \ell^- \bar{\nu}_\ell \text{anything})$ are not pure measurements because the underlying measured products of these with $B(b \rightarrow b\text{-baryon})$ were used to determine $B(b \rightarrow b\text{-baryon})$, as described in the note “Production and Decay of b -Flavored Hadrons.”

For inclusive branching fractions, e.g., $B \rightarrow D^\pm \text{anything}$, the values usually are multiplicities, not branching fractions. They can be greater than one.

Λ_b^0 DECAY MODES	Fraction (Γ_i/Γ)	Confidence level	p (MeV/c)
$J/\psi(1S)\Lambda$	$(4.7 \pm 2.8) \times 10^{-4}$		1744
$\Lambda_c^+ \pi^-$	seen		2345
$\Lambda_c^+ a_1(1260)^-$	seen		2155
$\Lambda_c^+ \ell^- \bar{\nu}_\ell \text{anything}$	[t] $(9.1 \pm 2.3) \%$	–	
$\Lambda_c^+ \ell^- \bar{\nu}_\ell$	$(5.0^{+1.9}_{-1.4}) \%$		2347
$\Lambda_c^+ \pi^+ \pi^- \ell^- \bar{\nu}_\ell$	$(5.6 \pm 3.1) \%$		2337
$p h^-$	[u] $< 2.3 \times 10^{-5}$	90%	2732
$p \pi^-$	$< 5.0 \times 10^{-5}$	90%	2732
$p K^-$	$< 5.0 \times 10^{-5}$	90%	2711
$\Lambda \gamma$	$< 1.3 \times 10^{-3}$	90%	2701

b -baryon ADMIXTURE (Λ_b , Ξ_b , Σ_b , Ω_b)

$$\text{Mean life } \tau = (1.209 \pm 0.049) \times 10^{-12} \text{ s}$$

These branching fractions are actually an average over weakly decaying b -baryons weighted by their production rates in Z decay (or high-energy $p\bar{p}$), branching ratios, and detection efficiencies. They scale with the LEP b -baryon production fraction $B(b \rightarrow b\text{-baryon})$ and are evaluated for our value $B(b \rightarrow b\text{-baryon}) = (10.0 \pm 2.0)\%$.

The branching fractions $B(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{anything})$ and $B(\Lambda_b^0 \rightarrow \Lambda_c^+ \ell^- \bar{\nu}_\ell \text{anything})$ are not pure measurements because the underlying measured products of these with $B(b \rightarrow b\text{-baryon})$ were used to determine $B(b \rightarrow b\text{-baryon})$, as described in the note "Production and Decay of b -Flavored Hadrons."

For inclusive branching fractions, e.g., $B \rightarrow D^\pm \text{anything}$, the values usually are multiplicities, not branching fractions. They can be greater than one.

b -baryon ADMIXTURE DECAY MODES

$(\Lambda_b, \Xi_b, \Sigma_b, \Omega_b)$	Fraction (Γ_i/Γ)	p (MeV/c)
$p\mu^- \bar{\nu} \text{anything}$	($4.9^{+ 2.1}_{- 1.8}$) %	—
$p\ell \bar{\nu}_\ell \text{anything}$	(4.7 ± 1.2) %	—
$p \text{anything}$	(59 ± 21) %	—

$\Xi^- \ell^- \bar{\nu}_\ell \text{anything}$	(5.5 ± 1.6) $\times 10^{-3}$	—

NOTES

- [a] The masses of the p and n are most precisely known in u (unified atomic mass units). The conversion factor to MeV, $1 \text{ u} = 931.494043 \pm 0.000080 \text{ MeV}$, is less well known than are the masses in u.
- [b] These two results are not independent, and both use the more precise measurement of $|q_{\bar{p}}/m_{\bar{p}}|/(q_p/m_p)$.
- [c] The limit is from neutrality-of-matter experiments; it assumes $q_n = q_p + q_e$. See also the charge of the neutron.
- [d] The first limit is for $p \rightarrow \text{anything}$ or "disappearance" modes of a bound proton. The second entry, a rough range of limits, assumes the dominant decay modes are among those investigated. For antiprotons the best limit, inferred from the observation of cosmic ray \bar{p} 's is $\tau_{\bar{p}} > 10^7$ yr, the cosmic-ray storage time, but this limit depends on a number of assumptions. The best direct observation of stored antiprotons gives $\tau_{\bar{p}}/B(\bar{p} \rightarrow e^- \gamma) > 7 \times 10^5$ yr.

[e] There is some controversy about whether nuclear physics and model dependence complicate the analysis for bound neutrons (from which the best limit comes). The first limit here is from reactor experiments with free neutrons.

[f] The parameters g_A , g_V , and g_{WM} for semileptonic modes are defined by $\bar{B}_f[\gamma_\lambda(g_V + g_A\gamma_5) + i(g_{WM}/m_{B_i}) \sigma_{\lambda\nu} q^\nu]B_i$, and ϕ_{AV} is defined by $g_A/g_V = |g_A/g_V| e^{i\phi_{AV}}$. See the “Note on Baryon Decay Parameters” in the neutron Particle Listings.

[g] Time-reversal invariance requires this to be 0° or 180° .

[h] This limit is for γ energies between 35 and 100 keV.

[i] The decay parameters γ and Δ are calculated from α and ϕ using

$$\gamma = \sqrt{1-\alpha^2} \cos\phi, \quad \tan\Delta = -\frac{1}{\alpha} \sqrt{1-\alpha^2} \sin\phi.$$

See the “Note on Baryon Decay Parameters” in the neutron Particle Listings.

[j] See the Listings for the pion momentum range used in this measurement.

[k] The error given here is only an educated guess. It is larger than the error on the weighted average of the published values.

[l] A theoretical value using QED.

[m] See the note on “ Λ_c^+ Branching Fractions” in the Λ_c^+ Particle Listings.

[n] This branching fraction includes all the decay modes of the final-state resonance.

[o] An ℓ indicates an e or a μ mode, not a sum over these modes.

[p] The value is for the sum of the charge states or particle/antiparticle states indicated.

[q] Assuming isospin conservation, so that the other third is $\Lambda_c^+ \pi^0 \pi^0$.

[r] A test that the isospin is indeed 0, so that the particle is indeed a Λ_c^+ .

[s] No absolute branching fractions have been measured. The value here is the branching *ratio* relative to $\Xi^- \pi^+ \pi^+$.

[t] Not a pure measurement. See note at head of Λ_b^0 Decay Modes.

[u] Here h^- means π^- or K^- .
