Magnetic Monopole Searches

Isolated supermassive monopole candidate events have not been confirmed. The most sensitive experiments obtain negative results.

Best cosmic-ray supermassive monopole flux limit:

\[ < 1.0 \times 10^{-15} \text{ cm}^{-2} \text{sr}^{-1} \text{s}^{-1} \text{ for } 1.1 \times 10^{-4} < \beta < 0.1 \]

Supersymmetric Particle Searches

Limits are based on the Minimal Supersymmetric Standard Model.

Assumptions include: 1) \( \tilde{\chi}_1^0 \) (or \( \tilde{\gamma} \)) is lightest supersymmetric particle;
2) \( R \)-parity is conserved; 3) With the exception of \( \tilde{t} \) and \( \tilde{b} \), all scalar quarks are assumed to be degenerate in mass and \( m_{\tilde{q}_R} = m_{\tilde{q}_L} \). 4) Limits for sleptons refer to the \( \tilde{\ell}_R \) states.

See the Particle Listings for a Note giving details of supersymmetry.

\[ \tilde{\chi}_i^0 \] — neutralinos (mixtures of \( \tilde{\gamma}, \tilde{Z}^0 \), and \( \tilde{H}_i^0 \))
- Mass \( m_{\chi_i^0} > 46 \text{ GeV}, \text{ CL } = 95\% \) [all \( \tan\beta \), all \( \Delta m_0 \), all \( m_0 \)]
- Mass \( m_{\chi_2^0} > 62.4 \text{ GeV}, \text{ CL } = 95\% \)
  \[ [1 < \tan\beta < 40, \text{ all } m_0, \text{ all } m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}] \]
- Mass \( m_{\chi_3^0} > 99.9 \text{ GeV}, \text{ CL } = 95\% \)
  \[ [1 < \tan\beta < 40, \text{ all } m_0, \text{ all } m_{\tilde{\chi}_3^0} - m_{\tilde{\chi}_1^0}] \]

\[ \tilde{\chi}_i^\pm \] — charginos (mixtures of \( \tilde{W}^\pm \) and \( \tilde{H}_i^\pm \))
- Mass \( m_{\chi_1^\pm} > 94 \text{ GeV}, \text{ CL } = 95\% \)
  \[ [\tan\beta < 40, m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} > 3 \text{ GeV}, \text{ all } m_0] \]
\(\tilde{\ell}\) — scalar electron (selectron)

Mass \(m > 73\) GeV, CL = 95%  \[all \ m_{\ell R} - m_{\chi_1^0}\]

\(\tilde{\mu}\) — scalar muon (smuon)

Mass \(m > 94\) GeV, CL = 95%

\[1 \leq \tan \beta \leq 40, \ m_{\tilde{\mu} R} - m_{\chi_1^0} > 10\) GeV\]

\(\tilde{\tau}\) — scalar tau (stau)

Mass \(m > 81.9\) GeV, CL = 95%

\[m_{\tilde{\tau} R} - m_{\chi_1^0} > 15\) GeV, all \(\theta_{\tau}\]\n
\(\tilde{q}\) — scalar quark (squark)

These limits include the effects of cascade decays, evaluated assuming a fixed value of the parameters \(\mu\) and \(\tan \beta\). The limits are weakly sensitive to these parameters over much of parameter space. Limits assume GUT relations between gaugino masses and the gauge coupling.

Mass \(m > 250\) GeV, CL = 95%  \[\tan \beta = 2, \ \mu < 0, \ A = 0\]

\(\tilde{b}\) — scalar bottom (sbottom)

Mass \(m > 89\) GeV, CL = 95%  \[m_{\tilde{b}_1} - m_{\chi_1^0} > 8\) GeV, all \(\theta_B\]\n
\(\tilde{t}\) — scalar top (stop)

Mass \(m > 95.7\) GeV, CL = 95%

\[\tilde{t} \rightarrow c \chi_1^0, \ all \ \theta_t, \ m_{\tilde{t}} - m_{\chi_1^0} > 10\) GeV\]

\(\tilde{g}\) — gluino

The limits summarised here refer to the high-mass region \(m_{\tilde{g}} \gtrsim 5\) GeV, and include the effects of cascade decays, evaluated assuming a fixed value of the parameters \(\mu\) and \(\tan \beta\). The limits are weakly sensitive to these parameters over much of parameter space. Limits assume GUT relations between gaugino masses and the gauge coupling.

Mass \(m > 195\) GeV, CL = 95%  \[any \ m_{\tilde{q}}\]

Mass \(m > 300\) GeV, CL = 95%  \[m_{\tilde{q}} = m_{\tilde{g}}\]

**Technicolor**

Searches for a color-octet techni-\(\rho\) constrain its mass to be greater than 260 to 480 GeV, depending on allowed decay channels. Similar bounds exist on the color-octet techni-\(\omega\).

Scale Limits $\Lambda$ for Contact Interactions
(the lowest dimensional interactions with four fermions)

If the Lagrangian has the form

$$\pm \frac{g^2}{2\Lambda^2} \bar{\psi}_L \gamma_\mu \psi_L \bar{\psi}_R \gamma^\mu \psi_R$$

(with $g^2/4\pi$ set equal to 1), then we define $\Lambda \equiv \Lambda_{LL}^{\pm}$. For the full definitions and for other forms, see the Note in the Listings on Searches for Quark and Lepton Compositeness in the full Review and the original literature.

  - Mass $m$ (from $q^*X$)

**Color Sextet and Octet Particles**

- **Color Sextet Quarks ($q_6$)**
  - Mass $m > 84$ GeV, CL = 95% (Stable $q_6$)

- **Color Octet Charged Leptons ($\ell_8$)**
  - Mass $m > 86$ GeV, CL = 95% (Stable $\ell_8$)

- **Color Octet Neutrinos ($\nu_8$)**
  - Mass $m > 110$ GeV, CL = 90% ($\nu_8 \rightarrow \nu g$)
Extra Dimensions

Please refer to the Extra Dimensions section of the full Review for a discussion of the model-dependence of these bounds, and further constraints.

**Constraints on the fundamental gravity scale**

\[ M_H > 1.1 \text{ TeV}, \text{ CL = 95\%} \] (dim-8 operators; \( \mu \mu \rightarrow e^+ e^-, \gamma \gamma \))

\[ M_D > 1.1 \text{ TeV}, \text{ CL = 95\%} \] (\( e^+ e^- \rightarrow G \gamma \); 2-flat dimensions)

\[ M_D > 3-1000 \text{ TeV} \] (astrophysics. and cosmology; 2-flat dimensions; limits depend on technique and assumptions)

**Constraints on the radius of the extra dimensions, for the case of two-flat dimensions of equal radii**

\[ r < 90-660 \text{ nm} \] (astrophysics; limits depend on technique and assumptions)

\[ r < 0.22 \text{ mm}, \text{ CL = 95\%} \] (direct tests of Newton’s law; cited in Extra Dimensions review)
