>1.1	>0.76	95	¹¹ BERGER 85B	PLUT	$E_{cm} = 34.7$ GeV

¹ A combined analysis of the data from ALEPH, DELPHI, L3, and OPAL.

² ABBIENDI 04G limits are from $e^+e^- \rightarrow e^+e^-$ cross section at $\sqrt{s} = 130\text{--}207$ GeV.

³ A combined analysis of the data from ALEPH, L3, and OPAL.

⁴ BUSKULIC 93Q uses the following prescription to obtain the limit: when the naive 95%CL limit is better than the statistically expected sensitivity for the limit, the latter is adopted for the limit.

⁵ This BUSKULIC 93Q value is from ALEPH data plus PEP/PETRA/TRISTAN data re-analyzed by KROHA 92.

⁶ KROHA 92 limit is from fit to BERGER 85B, BARTEL 86C, DERRICK 86B, FERNANDEZ 87B, BRAUNSCHWEIG 88, BEHREND 91B, and BEHREND 91C. The fit gives $\eta/\Lambda_{LL}^2 = +0.230 \pm 0.206$ TeV⁻².

⁷ BRAUNSCHWEIG 88 assumed $m_Z = 92$ GeV and $\sin^2\theta_W = 0.23$.

⁸ FERNANDEZ 87B assumed $\sin^2\theta_W = 0.22$.

⁹ BARTEL 86C assumed $m_Z = 93$ GeV and $\sin^2\theta_W = 0.217$.

¹⁰ DERRICK 86 assumed $m_Z = 93$ GeV and $g_V^2 = (-1/2 + 2\sin^2\theta_W)^2 = 0.004$.

¹¹ BERGER 85B assumed $m_Z = 93$ GeV and $\sin^2\theta_W = 0.217$.

SCALE LIMITS for Contact Interactions: $\Lambda(ee\mu\mu)$

Limits are for Λ_{LL}^\pm only. For other cases, see each reference.

>3.4	>2.7	95	31	KROHA	92	RVUE	

25 ABBIENDI 04G limits are from $e^+e^- \rightarrow \ell^+\ell^-$ cross section at $\sqrt{s} = 130-207$ GeV.

26 BABICH 03 obtain a bound $-0.175 \text{ TeV}^{-2} < 1/\Lambda_{LL}^2 < 0.095 \text{ TeV}^{-2}$ (95%CL) in a model independent analysis allowing all of $\Lambda_{LL}, \Lambda_{LR}, \Lambda_{RL}, \Lambda_{RR}$ to coexist.

27 From $e^+e^- \rightarrow e^+e^-, \mu^+\mu^-,$ and $\tau^+\tau^-$.

28 BUSKULIC 93Q uses the following prescription to obtain the limit: when the naive 95%CL limit is better than the statistically expected sensitivity for the limit, the latter is adopted for the limit.

29 This BUSKULIC 93Q value is from ALEPH data plus PEP/PETRA/TRISTAN data re-analyzed by KROHA 92.

30 HOWELL 92 limit is from $e^+e^- \rightarrow \mu^+\mu^-$ and $\tau^+\tau^-$.

31 KROHA 92 limit is from fit to most PEP/PETRA/TRISTAN data. The fit gives $\eta/\Lambda_{LL}^2 = -0.0200 \pm 0.0666 \text{ TeV}^{-2}$.

SCALE LIMITS for Contact Interactions: $\Lambda(eeqq)$

Limits are for Λ_{LL}^\pm only. For other cases, see each reference.

³² CHEUNG 01B is an update of BARGER 98E.

³³ BARATE 00I limits are from R_b and jet-charge asymmetry at 130–183 GeV.

³⁴ ABREU 99A limits are from flavor-tagged $e^+e^- \rightarrow q\bar{q}$ cross section at 130–172 GeV.

³⁵ ABULENCIA 06L limits are from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.

³⁶ ABBIENDI 04G limits are from $e^+e^- \rightarrow q\bar{q}$ cross section at $\sqrt{s} = 130$ –207 GeV.

³⁷ ADLOFF 03 limits are from the $d\sigma/dQ^2$ measurement of $e^\pm p \rightarrow e^\pm X$.

³⁸ ACHARD 02J limit is from the bound on the $e^+e^- \rightarrow t\bar{c}$ cross section. $\Lambda_{LL} = \Lambda_{LR} = \Lambda_{RL} = \Lambda_{RR}$ and $m_t = 175$ GeV are assumed.

³⁹ ABBIENDI 00R limits are from $e^+e^- \rightarrow q\bar{q}$ cross section at $\sqrt{s} = 130$ –189 GeV.

⁴⁰ ACCIARRI 00P limit is from $e^+e^- \rightarrow qq$ cross section at $\sqrt{s} = 130$ –189 GeV.

⁴¹ ADLOFF 00 limits are from the Q^2 spectrum measurement of $e^+p \rightarrow e^+X$.

⁴² BARATE 00I limits are from $e^+e^- \rightarrow q\bar{q}$ cross section and jet-charge asymmetry at 130–183 GeV.

⁴³ BREITWEG 00B limits are from Q^2 spectrum measurement of e^+p collisions. See their Table 3 for the limits of various models.

⁴⁴ ABBIENDI 99 limits are from $e^+e^- \rightarrow q\bar{q}$ cross section at 130–136, 161–172, 183 GeV.

⁴⁵ ABBIENDI 99 limits are from R_b at 130–136, 161–172, 183 GeV.

- 46 ABBOTT 99D limits are from e^+e^- mass distribution in $p\bar{p} \rightarrow e^+e^-X$ at $E_{\text{cm}} = 1.8$ TeV.
- 47 ZARNECKI 99 use data from HERA, LEP, Tevatron, and various low-energy experiments.
- 48 ACCIARRI 98J limits are from $e^+e^- \rightarrow q\bar{q}$ cross section at $E_{\text{cm}} = 130\text{--}172$ GeV.
- 49 ACKERSTAFF 98V limits are from $e^+e^- \rightarrow q\bar{q}$ at $E_{\text{cm}} = 130\text{--}172$ GeV.
- 50 ACKERSTAFF 98V limits are from R_b measurements at $E_{\text{cm}} = 130\text{--}172$ GeV.
- 51 BARGER 98E use data from HERA, LEP, Tevatron, and various low-energy experiments.
- 52 ABE 97T limits are from e^+e^- mass distribution in $\bar{p}p \rightarrow e^+e^-X$ at $E_{\text{cm}} = 1.8$ TeV.
- 53 ACKERSTAFF 97C limits are from $e^+e^- \rightarrow q\bar{q}$ cross section at $E_{\text{cm}} = 130\text{--}136$ GeV and 161 GeV.
- 54 ACKERSTAFF 97C limits are R_b measurements at $E_{\text{cm}} = 133$ GeV and 161 GeV.
- 55 DEANDREA 97 limit is from atomic parity violation of cesium. The limit is excluded if the contact interactions are parity conserving.
- 56 AID 95 limits are from the Q^2 spectrum measurement of $ep \rightarrow eX$.
- 57 ABE 91D limits are from e^+e^- mass distribution in $p\bar{p} \rightarrow e^+e^-X$ at $E_{\text{cm}} = 1.8$ TeV.
- 58 ADACHI 91 limits are from differential jet cross section. Universality of $\Lambda(eeqq)$ for five flavors is assumed.
- 59 BEHREND 91C is from data at $E_{\text{cm}} = 35\text{--}43$ GeV.
- 60 ABE 89L limits are from jet charge asymmetry. Universality of $\Lambda(eeqq)$ for five flavors is assumed.
- 61 The HAGIWARA 89 limit is derived from forward-backward asymmetry measurements of D/D^* mesons by ALTHOFF 83C, BARTEL 84E, and BARINGER 88.
- 62 The HAGIWARA 89 limit is derived from forward-backward asymmetry measurement of b hadrons by BARTEL 84D.

⁶⁸ The quoted limit is from inclusive dijet mass spectrum in $p\bar{p}$ collisions at $E_{cm}=1.8$ TeV. ABBOTT 99C also obtain $\Lambda_{LL}^- > 2.4$ TeV. All quarks are assumed composite.

⁶⁹ The quoted limit for ABBOTT 00E is from H_T distribution in $p\bar{p}$ collisions at $E_{cm}=1.8$ TeV. CTEQ4M PDF and $\mu=E_T^{\max}$ are assumed. For limits with different assumptions, see their Tables 2 and 3. All quarks are assumed composite.

⁷⁰ ABBOTT 98G limit is from dijet angular distribution in $p\bar{p}$ collisions at $E_{cm}=1.8$ TeV. All quarks are assumed composite.

- 71 BERTRAM 98 obtain limit on the scale of color-octet axial-vector flavor-universal contact interactions: $\Lambda_{A8} > 2.1$ TeV. They also obtain a limit $\Lambda_{V8} > 2.4$ TeV on a color-octet flavor-universal vectorial contact interaction.
- 72 ABE 96 finds that the inclusive jet cross section for $E_T > 200$ GeV is significantly higher than the $\mathcal{O}(\alpha_s^3)$ perturbative QCD prediction. This could be interpreted as the effect of a contact interaction with $\Lambda_{LL} \sim 1.6$ TeV. However, ABE 96 state that uncertainty in the parton distribution functions, higher-order QCD corrections, and the detector calibration may possibly account for the effect.
- 73 ABE 96S limit is from dijet angular distribution in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The limit for Λ_{LL}^- is > 1.4 TeV. ABE 96S also obtain limits for flavor symmetric contact interactions among all quark flavors: $\Lambda_{LL}^+ > 1.8$ TeV and $\Lambda_{LL}^- > 1.6$ TeV.
- 74 ABE 93G limit is from dijet mass distribution in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The limit is the weakest from several choices of structure functions and renormalization scale.
- 75 Limit is from inclusive jet cross-section data in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The limit takes into account uncertainties in choice of structure functions and in choice of process scale.
- 76 ABE 92M limit is from dijet angular distribution for $m_{dijet} > 550$ GeV in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV.
- 77 ALITTI 91B limit is from inclusive jet cross section in $p\bar{p}$ collisions at $E_{cm} = 630$ GeV. The limit takes into account uncertainties in choice of structure functions and in choice of process scale.
- 78 ABE 89H limit is from dijet angular distribution for $m_{dijet} > 200$ GeV at the Fermilab Tevatron Collider with $E_{cm} = 1.8$ TeV. The QCD prediction is quite insensitive to choice of structure functions and choice of process scale.
- 79 ARNISON 86C limit is from the study of inclusive high- p_T jet distributions at the CERN $\bar{p}p$ collider ($E_{cm} = 546$ and 630 GeV). The QCD prediction renormalized to the low- p_T region gives a good fit to the data.
- 80 ARNISON 86D limit is from the study of dijet angular distribution in the range $240 < m(dijet) < 300$ GeV at the CERN $\bar{p}p$ collider ($E_{cm} = 630$ GeV). QCD prediction using EHLQ structure function (EICHTEN 84) with $\Lambda_{QCD} = 0.2$ GeV for the choice of $Q^2 = p_T^2$ gives the best fit to the data.
- 81 APPEL 85 limit is from the study of inclusive high- p_T jet distributions at the CERN $\bar{p}p$ collider ($E_{cm} = 630$ GeV). The QCD prediction renormalized to the low- p_T region gives a good description of the data.
- 82 BAGNAIA 84C limit is from the study of jet p_T and dijet mass distributions at the CERN $\bar{p}p$ collider ($E_{cm} = 540$ GeV). The limit suffers from the uncertainties in comparing the data with the QCD prediction.

SCALE LIMITS for Contact Interactions: $\Lambda(\nu\nu qq)$

Limits are for Λ_{LL}^\pm only. For other cases, see each reference.

Λ_{LL}^+ (TeV)	Λ_{LL}^- (TeV)	CL%	DOCUMENT ID	TECN	COMMENT
>5.0	>5.4	95	83 MCFARLAND 98	CCFR	νN scattering

83 MCFARLAND 98 assumed a flavor universal interaction. Neutrinos were mostly of muon type.

MASS LIMITS for Excited e (e^*)

Most e^+e^- experiments assume one-photon or Z exchange. The limits from some e^+e^- experiments which depend on λ have assumed transition couplings which are chirality violating ($\eta_L = \eta_R$). However they can be interpreted as limits for chirality-conserving interactions after multiplying the coupling value λ by $\sqrt{2}$; see Note.

Excited leptons have the same quantum numbers as other ortholeptons. See also the searches for ortholeptons in the "Searches for Heavy Leptons" section.

Limits for Excited e (e^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow e^{*+}e^{*-}$ and thus rely only on the (electroweak) charge of e^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the e^* coupling is assumed to be of sequential type. Possible t channel contribution from transition magnetic coupling is neglected. All limits assume a dominant $e^* \rightarrow e\gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

⁸⁴ From $e^+ e^-$ collisions at $\sqrt{s} = 183\text{--}209$ GeV. $f = f'$ is assumed.

⁸⁵ From $e^+ e^-$ collisions at $\sqrt{s} = 189\text{--}209$ GeV. $f = f'$ is assumed. ACHARD 03B also obtain limit for $f = -f'$: $m_{e^*} > 96.6$ GeV.

⁸⁶ From $e^+ e^-$ collisions at $\sqrt{s} = 192\text{--}202$ GeV. $f=f'$ is assumed. ACCIARRI 01D also obtain limit for $f=-f'$: $m_{e^*} > 93.4$ GeV.

⁸⁷ From $e^+ e^-$ collisions at $\sqrt{s}=161\text{--}183$ GeV. $f=f'$ is assumed. ABBIENDI 00I also obtain limit for $f=-f'$ ($e^* \rightarrow \nu W$): $m_{e^*} > 86.0$ GeV.

⁸⁸ From $e^+ e^-$ collisions at $\sqrt{s}=189$ GeV. $f=f'$ is assumed. ACCIARRI 00E also obtain limit for $f=-f'$ ($e^* \rightarrow \nu W$): $m_{e^*} > 92.6$ GeV.

⁸⁹ From $e^+ e^-$ collisions at $\sqrt{s}= 183$ GeV. $f=f'$ is assumed. ABREU 990 also obtain limit for $f=-f'$ ($e^* \rightarrow \nu W$): $m_{e^*} > 81.3$ GeV.

⁹⁰ From $e^+ e^-$ collisions at $\sqrt{s}=170\text{--}172$ GeV. ACKERSTAFF 98C also obtain limit from $e^* \rightarrow \nu W$ decay mode: $m_{e^*} > 81.3$ GeV.

⁹¹ BARATE 98U obtain limits on the form factor. See their Fig. 14 for limits in mass-form factor plane.

⁹² From $e^+ e^-$ collisions at $\sqrt{s}= 161$ GeV.

⁹³ ABREU 97B also obtain limit from charged current decay mode $e^* \rightarrow \nu W$, $m_{e^*} > 70.9$ GeV.

⁹⁴ ABREU 97B also obtain limit from charged current decay mode $e^* \rightarrow \nu W$, $m_{e^*} > 44.6$ GeV.

⁹⁵ ACKERSTAFF 97 also obtain limit from charged current decay mode $e^* \rightarrow \nu W$, $m_{\nu_e^*} > 77.1$ GeV.

⁹⁶ From $e^+ e^-$ collisions at $\sqrt{s}= 130\text{--}136$ GeV.

⁹⁷ From $e^+ e^-$ collisions at $\sqrt{s}= 130\text{--}140$ GeV.

⁹⁸ BARDADIN-OTWINOWSKA 92 limit is independent of decay modes. Based on $\Delta\Gamma(Z)<36$ MeV.

⁹⁹ Limit is independent of e^* decay mode.

¹⁰⁰ ADEVA 90F is superseded by ADRIANI 93M.

¹⁰¹ Superseded by DECAMP 92.

¹⁰² ABE 88B limits assume $e^+ e^- \rightarrow e^{*+} e^{*-}$ with one photon exchange only and $e^* \rightarrow e\gamma$ giving $e e \gamma \gamma$.

Limits for Excited e (e^*) from Single Production

These limits are from $e^+ e^- \rightarrow e^* e$, $W \rightarrow e^* \nu$, or $e p \rightarrow e^* X$ and depend on transition magnetic coupling between e and e^* . All limits assume $e^* \rightarrow e\gamma$ decay except as noted. Limits from LEP, UA2, and H1 are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the $\lambda\text{--}m_{e^*}$ plane. See the original papers.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

- 120 ADLOFF 97 search for single e^* production in ep collisions with the decays $e^* \rightarrow e\gamma, eZ, \nu W$. See their Fig. 4 for the rejection limits on the product of the production cross section and the branching ratio into a specific decay channel.
- 121 BREITWEG 97C search for single e^* production in ep collisions with the decays $e^* \rightarrow e\gamma, eZ, \nu W$. $f=f'=2\Lambda/m_{e^*}$ is assumed for the e^* coupling. See their Fig. 9 for the exclusion plot in the mass-coupling plane.
- 122 ABREU 96K result is from e^+e^- collisions at $\sqrt{s}= 130\text{--}136$ GeV. See their Fig. 4 for the exclusion limit in the mass-coupling plane.
- 123 ACCIARRI 96D result is from e^+e^- collisions at $\sqrt{s}= 130\text{--}140$ GeV. See their Fig. 2 for the exclusion limit in the mass-coupling plane.
- 124 ALEXANDER 96Q result is from e^+e^- collisions at $\sqrt{s}= 130\text{--}140$ GeV. See their Fig. 3a for the exclusion limit in the mass-coupling plane.
- 125 BUSKULIC 96W result is from e^+e^- collisions at $\sqrt{s}= 130\text{--}140$ GeV. See their Fig. 3 for the exclusion limit in the mass-coupling plane.
- 126 DERRICK 95B search for single e^* production via $e^*e\gamma$ coupling in ep collisions with the decays $e^* \rightarrow e\gamma, eZ, \nu W$. See their Fig. 13 for the exclusion plot in the $m_{e^*}-\lambda\gamma$ plane.

- 127 ABT 93 search for single e^* production via $e^*e\gamma$ coupling in ep collisions with the decays $e^* \rightarrow e\gamma, eZ, \nu W$. See their Fig. 4 for exclusion plot in the $m_{e^*}-\lambda_\gamma$ plane.
- 128 DERRICK 93B search for single e^* production via $e^*e\gamma$ coupling in ep collisions with the decays $e^* \rightarrow e\gamma, eZ, \nu W$. See their Fig. 3 for exclusion plot in the $m_{e^*}-\lambda_\gamma$ plane.
- 129 Superseded by ADRIANI 93M.
- 130 Superseded by DECAMP 92.
- 131 ABE 88B limits use $e^+e^- \rightarrow ee^*$ where t-channel photon exchange dominates giving $e\gamma(e)$ (quasi-real compton scattering).
- 132 ANSARI 87D is at $E_{cm} = 546-630$ GeV.

Limits for Excited e (e^*) from $e^+e^- \rightarrow \gamma\gamma$

These limits are derived from indirect effects due to e^* exchange in the t channel and depend on transition magnetic coupling between e and e^* . All limits are for $\lambda_\gamma = 1$. All limits except ABE 89J and ACHARD 02D are for nonchiral coupling with $\eta_L = \eta_R = 1$. We choose the chiral coupling limit as the best limit and list it in the Summary Table.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

- 133 ABDALLAH 04N also obtain a limit on the excited electron mass with $e e^*$ chiral coupling, $m_{e^*} > 295$ GeV at 95% CL.
- 134 ACCIARRI 00G also obtain a limit on e^* with chiral coupling, $m_{e^*} > 213$ GeV.
- 135 BARATE 98U is from $e^+ e^-$ collision at $\sqrt{s}=M_Z$. See their Fig. 5 for limits in mass-coupling plane
- 136 ACCIARRI 97W also obtain a limit on e^* with chiral coupling, $m_{e^*} > 157$ GeV (95%CL).
- 137 BUSKULIC 93Q obtain $\Lambda^+ > 121$ GeV (95%CL) from ALEPH experiment and $\Lambda^+ > 135$ GeV from combined TRISTAN and ALEPH data. These limits roughly correspond to limits on m_{e^*} .
- 138 ADRIANI 92B superseded by ACCIARRI 95G.
- 139 BARDADIN-OTWINOWSKA 92 limit from fit to the combined data of DECAMP 92, ABREU 91E, ADEVA 90K, AKRAWY 91F.
- 140 SHIMOZAWA 92 fit the data to the limiting form of the cross section with $m_{e^*} \gg E_{\text{cm}}$ and obtain $m_{e^*} > 168$ GeV at 95%CL. Use of the full form would reduce this limit by a few GeV. The statistically unexpected large value is due to fluctuation in the data.
- 141 The ABE 89J limit assumes chiral coupling. This corresponds to $\lambda_\gamma = 0.7$ for nonchiral coupling.

Indirect Limits for Excited e (e^*)

These limits make use of loop effects involving e^* and are therefore subject to theoretical uncertainty.

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
● ● ● We do not use the following data for averages, fits, limits, etc. ● ● ●			
	142 DORENBOS...	89	CHRM $\bar{\nu}_\mu e \rightarrow \bar{\nu}_\mu e$ and $\nu_\mu e \rightarrow \nu_\mu e$
	143 GRIFOLS	86	THEO $\nu_\mu e \rightarrow \nu_\mu e$
	144 RENARD	82	THEO $g-2$ of electron
142	DORENBOSCH 89 obtain the limit $\lambda_\gamma^2 \Lambda_{\text{cut}}^2 / m_{e^*}^2 < 2.6$ (95% CL), where Λ_{cut} is the cutoff scale, based on the one-loop calculation by GRIFOLS 86. If one assumes that $\Lambda_{\text{cut}} = 1$ TeV and $\lambda_\gamma = 1$, one obtains $m_{e^*} > 620$ GeV. However, one generally expects $\lambda_\gamma \approx m_{e^*} / \Lambda_{\text{cut}}$ in composite models.		
143	GRIFOLS 86 uses $\nu_\mu e \rightarrow \nu_\mu e$ and $\bar{\nu}_\mu e \rightarrow \bar{\nu}_\mu e$ data from CHARM Collaboration to derive mass limits which depend on the scale of compositeness.		
144	RENARD 82 derived from $g-2$ data limits on mass and couplings of e^* and μ^* . See figures 2 and 3 of the paper.		

MASS LIMITS for Excited μ (μ^*)

Limits for Excited μ (μ^*) from Pair Production

These limits are obtained from $e^+ e^- \rightarrow \mu^{*+} \mu^{*-}$ and thus rely only on the (electroweak) charge of μ^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the μ^* coupling is assumed to be of sequential type. All limits assume a dominant $\mu^* \rightarrow \mu \gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

145 From e^+e^- collisions at $\sqrt{s} = 183\text{--}209$ GeV. $f = f'$ is assumed.

146 From e^+e^- collisions at $\sqrt{s} = 189\text{--}209$ GeV. $f = f'$ is assumed. ACHARD 03B also obtain limit for $f = -f'$: $m_{\mu^*} > 96.6$ GeV.

147 From e^+e^- collisions at $\sqrt{s} = 192\text{--}202$ GeV. $f=f'$ is assumed. ACCIARRI 01D also obtain limit for $f=-f'$: $m_{\mu^*} > 93.4$ GeV.

148 From e^+e^- collisions at $\sqrt{s}=161\text{--}183$ GeV. $f=f'$ is assumed. ABBIENDI 00I also obtain limit for $f=-f'$ ($\mu^* \rightarrow \nu W$): $m_{\mu^*} > 86.0$ GeV.

149 From e^+e^- collisions at $\sqrt{s}=189$ GeV. $f=f'$ is assumed. ACCIARRI 00E also obtain limit for $f=-f'$ ($\mu^* \rightarrow \nu W$): $m_{\mu^*} > 92.6$ GeV.

150 From e^+e^- collisions at $\sqrt{s}= 183$ GeV. $f=f'$ is assumed. ABREU 99O also obtain limit for $f=-f'$ ($\mu^* \rightarrow \nu W$): $m_{\mu^*} > 81.3$ GeV.

151 From e^+e^- collisions at $\sqrt{s}=170\text{--}172$ GeV. ACKERSTAFF 98C also obtain limit from $\mu^* \rightarrow \nu W$ decay mode: $m_{\mu^*} > 81.3$ GeV.

- 152 BARATE 98U obtain limits on the form factor. See their Fig. 14 for limits in mass-form factor plane.
- 153 From e^+e^- collisions at $\sqrt{s}=161$ GeV.
- 154 ABREU 97B also obtain limit from charged current decay mode $\mu^* \rightarrow \nu W$, $m_{\mu^*} > 70.9$ GeV.
- 155 ABREU 97B also obtain limit from charged current decay mode $\mu^* \rightarrow \nu W$, $m_{\mu^*} > 44.6$ GeV.
- 156 ACKERSTAFF 97 also obtain limit from charged current decay mode $\mu^* \rightarrow \nu W$, $m_{\nu_{\mu^*}} > 77.1$ GeV.
- 157 From e^+e^- collisions at $\sqrt{s}=130-136$ GeV.
- 158 From e^+e^- collisions at $\sqrt{s}=130-140$ GeV.
- 159 BARDADIN-OTWINOWSKA 92 limit is independent of decay modes. Based on $\Delta\Gamma(Z) < 36$ MeV.
- 160 Limit is independent of μ^* decay mode.
- 161 Superseded by ADRIANI 93M.
- 162 Superseded by DECAMP 92.

Limits for Excited μ (μ^*) from Single Production

These limits are from $e^+e^- \rightarrow \mu^*\mu$ and depend on transition magnetic coupling between μ and μ^* . All limits assume $\mu^* \rightarrow \mu\gamma$ decay. Limits from LEP are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the $\lambda-m_{\mu^*}$ plane. See the original papers.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

- 184 From $e^+ e^-$ collisions at $\sqrt{s} = 183\text{--}209$ GeV. $f = f'$ is assumed.
- 185 From $e^+ e^-$ collisions at $\sqrt{s} = 189\text{--}209$ GeV. $f = f'$ is assumed. ACHARD 03B also obtain limit for $f = -f'$: $m_{\tau^*} > 96.6$ GeV.
- 186 From $e^+ e^-$ collisions at $\sqrt{s} = 192\text{--}202$ GeV. $f=f'$ is assumed. ACCIARRI 01D also obtain limit for $f=-f'$: $m_{\tau^*} > 93.4$ GeV.
- 187 From $e^+ e^-$ collisions at $\sqrt{s}=161\text{--}183$ GeV. $f=f'$ is assumed. ABBIENDI 00I also obtain limit for $f=-f'$ ($\tau^* \rightarrow \nu W$): $m_{\tau^*} > 86.0$ GeV.
- 188 From $e^+ e^-$ collisions at $\sqrt{s}=189$ GeV. $f=f'$ is assumed. ACCIARRI 00E also obtain limit for $f=-f'$ ($\tau^* \rightarrow \nu W$): $m_{\tau^*} > 92.6$ GeV.
- 189 From $e^+ e^-$ collisions at $\sqrt{s}= 183$ GeV. $f=f'$ is assumed. ABREU 990 also obtain limit for $f=-f'$ ($\tau^* \rightarrow \nu W$): $m_{\tau^*} > 81.3$ GeV.
- 190 From $e^+ e^-$ collisions at $\sqrt{s}=170\text{--}172$ GeV. ACKERSTAFF 98C also obtain limit from $\tau^* \rightarrow \nu W$ decay mode: $m_{\tau^*} > 81.3$ GeV.
- 191 BARATE 98U obtain limits on the form factor. See their Fig. 14 for limits in mass-form factor plane.
- 192 From $e^+ e^-$ collisions at $\sqrt{s}= 161$ GeV.
- 193 ABREU 97B also obtain limit from charged current decay mode $\tau^* \rightarrow \nu W$, $m_{\tau^*} > 70.9$ GeV.
- 194 ABREU 97B also obtain limit from charged current decay mode $\tau^* \rightarrow \nu W$, $m_{\tau^*} > 44.6$ GeV.
- 195 ACKERSTAFF 97 also obtain limit from charged current decay mode $\tau^* \rightarrow \nu W$, $m_{\nu_{\tau^*}} > 77.1$ GeV.
- 196 From $e^+ e^-$ collisions at $\sqrt{s}= 130\text{--}136$ GeV.
- 197 From $e^+ e^-$ collisions at $\sqrt{s}= 130\text{--}140$ GeV.
- 198 BARDADIN-OTWINOWSKA 92 limit is independent of decay modes. Based on $\Delta\Gamma(Z)<36$ MeV.
- 199 Limit is independent of τ^* decay mode.
- 200 Superseded by ADRIANI 93M.
- 201 Superseded by DECAMP 92.

Limits for Excited τ (τ^*) from Single Production

These limits are from $e^+ e^- \rightarrow \tau^* \tau$ and depend on transition magnetic coupling between τ and τ^* . All limits assume $\tau^* \rightarrow \tau \gamma$ decay. Limits from LEP are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the $\lambda\text{--}m_{\tau^*}$ plane. See the original papers.

MASS LIMITS for Excited Neutrino (ν^*)

Limits for Excited ν (ν^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow \nu^*\nu^*$ and thus rely only on the (electroweak) charge of ν^* . Form factor effects are ignored unless noted. The ν^* coupling is assumed to be of sequential type unless otherwise noted. All limits assume a dominant $\nu^* \rightarrow \nu\gamma$ decay except the limits from $\Gamma(Z)$.

- 222 From e^+e^- collisions at $\sqrt{s} = 189\text{--}209$ GeV. $f = -f'$ is assumed. ACHARD 03B also obtain limit for $f = f'$: $m_{\nu_e^*} > 101.7$ GeV, $m_{\nu_\mu^*} > 101.8$ GeV, and $m_{\nu_\tau^*} > 92.9$ GeV. See their Fig. 4 for the exclusion plot in the mass-coupling plane.
- 223 From e^+e^- collisions at $\sqrt{s} = 192\text{--}209$ GeV, ABBIENDI 04N obtain limit on $\sigma(e^+e^- \rightarrow \nu^*\nu^*) B^2(\nu^* \rightarrow \nu\gamma)$. See their Fig.2. The limit ranges from 20 to 45fb for $m_{\nu^*} > 45$ GeV.
- 224 From e^+e^- collisions at $\sqrt{s} = 192\text{--}202$ GeV. $f=f'$ is assumed. ACCIARRI 01D also obtain limit for $f=-f'$: $m_{\nu_e^*} > 99.1$ GeV, $m_{\nu_\mu^*} > 99.3$ GeV, $m_{\nu_\tau^*} > 90.5$ GeV.
- 225 From e^+e^- collisions at $\sqrt{s}=161\text{--}183$ GeV. $f=-f'$ (photonic decay) is assumed. ABBIENDI 00I also obtain limit for $f=f'$ ($\nu^* \rightarrow \ell W$): $m_{\nu_e^*} > 91.1$ GeV, $m_{\nu_\mu^*} > 91.1$ GeV, $m_{\nu_\tau^*} > 83.1$ GeV.
- 226 From e^+e^- collisions at $\sqrt{s}= 189$ GeV. ABBIENDI,G 00D obtain limit on $\sigma(e^+e^- \rightarrow \nu^*\nu^*)B(\nu^* \rightarrow \nu\gamma)^2$. See their Fig. 14. The limit ranges from 50 to 80 fb for $\sqrt{s}/2=95$ GeV $> m_{\nu^*} > 45$ GeV.
- 227 From e^+e^- collisions at $\sqrt{s}=189$ GeV. $f=-f'$ (photonic decay) is assumed. ACCIARRI 00E also obtain limit for $f=f'$ ($\nu^* \rightarrow \ell W$): $m_{\nu_e^*} > 93.9$ GeV, $m_{\nu_\mu^*} > 94.0$ GeV, $m_{\nu_\tau^*} > 91.5$ GeV.
- 228 From e^+e^- collisions at $\sqrt{s}= 130\text{--}183$ GeV, ABBIENDI 99F obtain limit on $\sigma(e^+e^- \rightarrow \nu^*\nu^*) B(\nu^* \rightarrow \nu\gamma)^2$. See their Fig. 13. The limit ranges from 0.094 to 0.14 pb for $\sqrt{s}/2 > m_{\nu^*} > 45$ GeV.
- 229 From e^+e^- collisions at $\sqrt{s}= 183$ GeV. $f=-f'$ is assumed. ABREU 99O also obtain limit for $f=f'$: $m_{\nu_e^*} > 87.3$ GeV, $m_{\nu_\mu^*} > 88.0$ GeV, $m_{\nu_\tau^*} > 81.0$ GeV.
- 230 From e^+e^- collisions at $\sqrt{s}=170\text{--}172$ GeV. ACKERSTAFF 98C also obtain limit from charged decay modes: $m_{\nu_e^*} > 84.1$ GeV, $m_{\nu_\mu^*} > 83.9$ GeV, and $m_{\nu_\tau^*} > 79.4$ GeV.
- 231 BARATE 98U obtain limits on the form factor. See their Fig. 14 for limits in mass-form factor plane.
- 232 From e^+e^- collisions at $\sqrt{s}= 161$ GeV.
- 233 ABREU 97B also obtain limits from charged current decay modes, $m_{\nu^*} > 56.4$ GeV.
- 234 ABREU 97B also obtain limits from charged current decay modes, $m_{\nu^*} > 44.9$ GeV.
- 235 ACCIARRI 97G also obtain limits from charged current decay mode $\nu_e^* \rightarrow e W$, $m_{\nu^*} > 64.5$ GeV.
- 236 ACKERSTAFF 97 also obtain limits from charged current decay modes $m_{\nu_e^*} > 78.3$ GeV, $m_{\nu_\mu^*} > 78.9$ GeV, $m_{\nu_\tau^*} > 76.2$ GeV.
- 237 From e^+e^- collisions at $\sqrt{s}= 130\text{--}140$ GeV.
- 238 ACCIARRI 96D also obtain limit from $\nu^* \rightarrow e W$ decay mode: $m_{\nu^*} > 57.3$ GeV.
- 239 From e^+e^- collisions at $\sqrt{s}= 130\text{--}136$ GeV.
- 240 ALEXANDER 96Q also obtain limits from charged current decay modes: $m_{\nu_e^*} > 66.2$ GeV, $m_{\nu_\mu^*} > 66.5$ GeV, $m_{\nu_\tau^*} > 64.7$ GeV.
- 241 BARDADIN-OTWINOWSKA 92 limit is for Dirac ν^* . Based on $\Delta\Gamma(Z) < 36$ MeV. The limit is 36.4 GeV for Majorana ν^* , 45.4 GeV for homodoublet ν^* .
- 242 Limit is based on $B(Z \rightarrow \nu^*\bar{\nu}^*) \times B(\nu^* \rightarrow \nu\gamma)^2 < 5 \times 10^{-5}$ (95%CL) assuming Dirac ν^* , $B(\nu^* \rightarrow \nu\gamma) = 1$.

- 243 Limit is for Dirac ν^* . The limit is 34.6 GeV for Majorana ν^* , 45.4 GeV for homodoublet ν^* .
- 244 DECAMP 900 limit is from excess $\Delta\Gamma(Z) < 89$ MeV. The above value is for Dirac ν^* ; 26.6 GeV for Majorana ν^* ; 44.8 GeV for homodoublet ν^* .
- 245 Superseded by DECAMP 92.
- 246 DECAMP 900 limit based on $B(Z \rightarrow \nu^* \nu^*) \cdot B(\nu^* \rightarrow \nu \gamma)^2 < 7 \times 10^{-5}$ (95%CL), assuming Dirac ν^* , $B(\nu^* \rightarrow \nu \gamma) = 1$.

Limits for Excited ν (ν^*) from Single Production

These limits are from $e^+e^- \rightarrow \nu\nu^*$, $Z \rightarrow \nu\nu^*$, or $ep \rightarrow \nu^*X$ and depend on transition magnetic coupling between ν/e and ν^* . Assumptions about ν^* decay mode are given in footnotes.

- 261 ABREU 97i limit is from $Z \rightarrow \nu\nu^*$. See their Fig. 12 for the exclusion limit in the mass-coupling plane.
- 262 ABREU 97J limit is from $Z \rightarrow \nu\nu^*$. See their Fig. 5 for the exclusion limit in the mass-coupling plane.
- 263 See Fig. 2 and Fig. 3 of ACCIARRI 97G for the exclusion limit in the mass-coupling plane.
- 264 ACKERSTAFF 97 result is from e^+e^- collisions at $\sqrt{s} = 161$ GeV, for homodoublet ν^* . See their Fig. 3 for the exclusion limit in the mass-coupling plane.
- 265 ADLOFF 97 search for single e^* production in ep collisions with the decays $e^* \rightarrow e\gamma, eZ, \nu W$. See their Fig. 4 for the rejection limits on the product of the production cross section and the branching ratio.
- 266 BREITWEG 97C search for single ν^* production in ep collisions with the decay $\nu^* \rightarrow \nu\gamma$. $f = -f' = 2\Lambda/m_{\nu^*}$ is assumed for the ν^* coupling. See their Fig. 10 for the exclusion plot in the mass-coupling plane.
- 267 ACCIARRI 96D result is from e^+e^- collisions at $\sqrt{s} = 130\text{--}140$ GeV. See their Fig. 2 for the exclusion limit in the mass-coupling plane.

- 268 ALEXANDER 96Q result is from e^+e^- collisions at $\sqrt{s}=130\text{--}140$ GeV for homodoublet ν^* . See their Fig. 3b and Fig. 3c for the exclusion limit in the mass-coupling plane.
- 269 BUSKULIC 96W result is from e^+e^- collisions at $\sqrt{s}=130\text{--}140$ GeV. See their Fig. 4 for the exclusion limit in the mass-coupling plane.
- 270 DERRICK 95B search for single ν^* production via ν^*eW coupling in ep collisions with the decays $\nu^* \rightarrow \nu\gamma, \nu Z, eW$. See their Fig. 14 for the exclusion plot in the $m_{\nu^*}\text{--}\lambda\gamma$ plane.
- 271 ABT 93 search for single ν^* production via ν^*eW coupling in ep collisions with the decays $\nu^* \rightarrow \nu\gamma, \nu Z, eW$. See their Fig. 4 for exclusion plot in the $m_{\nu^*}\text{--}\lambda_W$ plane.
- 272 See Fig. 5 of BARDADIN-OTWINOWSKA 92 for combined limit of ADEVA 90o, DECAMP 90o, and DECAMP 92.
- 273 DECAMP 92 limit is based on $B(Z \rightarrow \nu^*\bar{\nu}) \times B(\nu^* \rightarrow \nu\gamma) < 2.7 \times 10^{-5}$ (95%CL) assuming Dirac ν^* , $B(\nu^* \rightarrow \nu\gamma) = 1$.
- 274 Limit is either for $\nu^* \rightarrow \nu\gamma$ or $\nu^* \rightarrow eW$.
- 275 Superseded by ADRIANI 93M.
- 276 DECAMP 90o limit based on $B(Z \rightarrow \nu\nu^*) \cdot B(\nu^* \rightarrow \nu\gamma) < 6 \times 10^{-5}$ (95%CL), assuming $B(\nu^* \rightarrow \nu\gamma) = 1$.
- 277 Superseded by DECAMP 92.

MASS LIMITS for Excited q (q^*)

Limits for Excited q (q^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow q^*\bar{q}^*$ and thus rely only on the (electroweak) charge of the q^* . Form factor effects are ignored unless noted. Assumptions about the q^* decay are given in the comments and footnotes.

285 ABAZOV 04C assume $f_S = f = f' = \Lambda/m_{q^*}$.

286 ABE 97G search for new particle decaying to dijets.

287 ABE 95N assume a degenerate u^* and d^* with $f_S = f = f' = \Lambda/m_{q^*}$. See their Fig. 4 for the excluded region in $m_{q^*} - f$ plane.

- 288 ABAZOV 06F assume q^* production via qg fusion and via contact interactions. The quoted limit is for $\Lambda = m_{q^*}$.
- 289 CHEKANOV 02D search for single q^* production in ep collisions with the decays $q^* \rightarrow q\gamma, qZ, qW$. $f_s = 0$ and $f = f' = \Lambda/m_{q^*}$ is assumed for the q^* coupling. See their Fig. 5b for the exclusion plot in the mass-coupling plane.
- 290 ADLOFF 00E search for single q^* production in ep collisions with the decays $q^* \rightarrow q\gamma, qZ, qW$. $f_s=0$ and $f=f'=\Lambda/m_{q^*}$ is assumed for the q^* coupling. See their Fig. 11 for the exclusion plot in the mass-coupling plane.
- 291 ABREU 99O result is from e^+e^- collisions at $\sqrt{s}=183$ GeV. See their Fig. 6 for the exclusion limit in the mass-coupling plane.
- 292 BARATE 98U obtain limits on the Zq^* coupling. See their Fig. 16 for limits in mass-coupling plane
- 293 ADLOFF 97 search for single q^* production in ep collisions with the decay $q^* \rightarrow q\gamma$. See their Fig. 6 for the rejection limits on the product of the production cross section and the branching ratio.
- 294 BREITWEG 97C search for single q^* production in ep collisions with the decays $q^* \rightarrow q\gamma, qW$. $f_s=0$, and $f=-f'=2\Lambda/m_{q^*}$ is assumed for the q^* coupling. See their Fig. 11 for the exclusion plot in the mass-coupling plane.
- 295 DERRICK 95B search for single q^* production via $q^*q\gamma$ coupling in ep collisions with the decays $q^* \rightarrow qW, qZ, qg, q\gamma$. See their Fig. 15 for the exclusion plot in the $m_{q^*}-\lambda\gamma$ plane.
- 296 ABE 94 search for resonances in jet- γ and jet- W invariant mass in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. The limit is for $f_s = f = f' = \Lambda/m_{q^*}$ and u^* and d^* are assumed to be degenerate. See their Fig. 4 for the excluded region in m_{q^*} - f plane.
- 297 Assumes $B(q^* \rightarrow qg) = 1$.
- 298 ALITTI 93 search for resonances in the two-jet invariant mass. The limit is for $f_s = f = f' = \Lambda/m_{q^*}$. u^* and d^* are assumed to be degenerate. If not, the limit for u^* (d^*) is 277 (247) GeV if $m_{d^*} \gg m_{u^*}$ ($m_{u^*} \gg m_{d^*}$).
- 299 ABREU 92D give $\sigma(e^+e^- \rightarrow Z \rightarrow q^*\bar{q} \text{ or } q\bar{q}^*) \times B(q^* \rightarrow q\gamma) < 15$ pb (95% CL) for $m_{q^*} < 80$ GeV.
- 300 ADRIANI 92F search for $Z \rightarrow qq^*$ with $q^* \rightarrow q\gamma$ and give the limit $\sigma_Z \cdot B(Z \rightarrow qq^*) \cdot B(q^* \rightarrow q\gamma) < (2-10)$ pb (95%CL) for $m_{q^*} = (46-82)$ GeV.
- 301 Assumes $B(q^* \rightarrow q\gamma) = 0.1$.
- 302 ALBAJAR 89 give $\sigma(q^* \rightarrow W + \text{jet})/\sigma(W) < 0.019$ (90% CL) for $m_{q^*} > 220$ GeV.
- 303 BEHREND 86C has $E_{cm} = 42.5-46.8$ GeV. See their Fig. 3 for excluded region in the $m_{q^*} - (\lambda_\gamma/m_{q^*})^2$ plane. The limit is for $\lambda_\gamma = 1$ with $\eta_L = \eta_R = 1$.

MASS LIMITS for Color Sextet Quarks (q_6)

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>84	95	304 ABE	89D CDF	$p\bar{p} \rightarrow q_6\bar{q}_6$

304 ABE 89D look for pair production of unit-charged particles which leave the detector before decaying. In the above limit the color sextet quark is assumed to fragment into a unit-charged or neutral hadron with equal probability and to have long enough lifetime not to decay within the detector. A limit of 121 GeV is obtained for a color decuplet.

MASS LIMITS for Color Octet Charged Leptons (ℓ_8)

$$\lambda \equiv m_{\ell_8}/\Lambda$$

none 5–23.2	95	309 BARTEL 87B	JADE	e_8, μ_8, τ_8 : e^+e^- ; R
	95	309 BARTEL 87B	JADE	μ_8 : $e^+e^- \rightarrow \mu\mu +$ jets
		310 BARTEL 85K	JADE	e_8 : $e^+e^- \rightarrow gg$; R

305 ABE 89D look for pair production of unit-charged particles which leave the detector before decaying. In the above limit the color octet lepton is assumed to fragment into a unit-charged or neutral hadron with equal probability and to have long enough lifetime not to decay within the detector. The limit improves to 99 GeV if it always fragments into a unit-charged hadron.

306 ABT 93 search for e_8 production via e -gluon fusion in ep collisions with $e_8 \rightarrow eg$. See their Fig. 3 for exclusion plot in the $m_{e_8}-\Lambda$ plane for $m_{e_8} = 35-220$ GeV.

307 KIM 90 is at $E_{cm} = 50-60.8$ GeV. The same assumptions as in BARTEL 87B are used.

308 KIM 90 result $(m_{e_8}\Lambda_M)^{1/2} > 178.4$ GeV (95%CL, $\alpha_S = 0.16$ used) is subject to the same restriction as for BARTEL 85K.

309 BARTEL 87B is at $E_{cm} = 46.3-46.78$ GeV. The limits assume ℓ_8 pair production cross sections to be eight times larger than those of the corresponding heavy lepton pair production.

310 In BARTEL 85K, R can be affected by $e^+e^- \rightarrow gg$ via e_q exchange. Their limit $m_{e_8} > 173$ GeV (CL=95%) at $\lambda = m_{e_8}/\Lambda_M = 1$ ($\eta_L = \eta_R = 1$) is not listed above because the cross section is sensitive to the product $\eta_L\eta_R$, which should be absent in ordinary theory with electronic chiral invariance.

MASS LIMITS for Color Octet Neutrinos (ν_8)

$$\lambda \equiv m_{\nu_8}/\Lambda$$

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>110	90	311 BARGER 89	RVUE	ν_8 : $p\bar{p} \rightarrow \nu_8\bar{\nu}_8$
● ● ● We do not use the following data for averages, fits, limits, etc. ● ● ●				
none 3.8–29.8	95	312 KIM 90	AMY	ν_8 : $e^+e^- \rightarrow$ acoplanar jets
none 9–21.9	95	313 BARTEL 87B	JADE	ν_8 : $e^+e^- \rightarrow$ acoplanar jets

- 311 BARGER 89 used ABE 89B limit for events with large missing transverse momentum. Two-body decay $\nu_g \rightarrow \nu g$ is assumed.
- 312 KIM 90 is at $E_{\text{cm}} = 50\text{--}60.8$ GeV. The same assumptions as in BARTEL 87B are used.
- 313 BARTEL 87B is at $E_{\text{cm}} = 46.3\text{--}46.78$ GeV. The limit assumes the ν_g pair production cross section to be eight times larger than that of the corresponding heavy neutrino pair production. This assumption is not valid in general for the weak couplings, and the limit can be sensitive to its $SU(2)_L \times U(1)_Y$ quantum numbers.

MASS LIMITS for W_8 (Color Octet W Boson)

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
• • •	We do not use the following data for averages, fits, limits, etc. • • •		
	314 ALBAJAR 89	UA1	$p\bar{p} \rightarrow W_8 X,$ $W_8 \rightarrow Wg$
314	ALBAJAR 89		give $\sigma(W_8 \rightarrow W + \text{jet})/\sigma(W) < 0.019$ (90% CL) for $m_{W_8} > 220$ GeV.
