

# $\Sigma(1670)$ Bumps

$$I(J^P) = 1(?^?)$$

OMITTED FROM SUMMARY TABLE

Formation experiments are listed separately in the preceding entry.

Probably there are two states at the same mass with the same quantum numbers, one decaying to  $\Sigma\pi$  and  $\Lambda\pi$ , the other to  $\Lambda(1405)\pi$ . See the note in front of the preceding entry.

### $\Sigma(1670)$ FOOTNOTES

- <sup>1</sup> Total cross-section bump with  $(J+1/2) \Gamma_{el} / \Gamma_{total} = 0.23$ .
- <sup>2</sup> Enhancements in  $\Sigma\pi$  and  $\Sigma\pi\pi$  cross sections.
- <sup>3</sup> Backward production in the  $\Lambda\pi^- K^+$  final state.
- <sup>4</sup> Depending on production angle.
- <sup>5</sup> APSELL 74, ESTES 74, and TIMMERMANS 76 find strong branching ratio dependence on production angle, as in earlier production experiments.
