

N BARYONS ($S = 0, I = 1/2$)

$p, N^+ = uud; \quad n, N^0 = udd$

p

$$I(J^P) = \frac{1}{2}(\frac{1}{2}^+)$$

Mass $m = 1.00727646677 \pm 0.00000000010$ u

Mass $m = 938.272013 \pm 0.000023$ MeV [a]

$|m_p - m_{\bar{p}}|/m_p < 2 \times 10^{-9}$, CL = 90% [b]

$|\frac{q_p}{m_p}| / (\frac{q_p}{m_p}) = 0.99999999991 \pm 0.00000000009$

$|q_p + q_{\bar{p}}|/e < 2 \times 10^{-9}$, CL = 90% [b]

$|q_p + q_e|/e < 1.0 \times 10^{-21}$ [c]

Magnetic moment $\mu = 2.792847356 \pm 0.000000023$ μ_N

$(\mu_p + \mu_{\bar{p}}) / \mu_p = (-0.1 \pm 2.1) \times 10^{-3}$

Electric dipole moment $d < 0.54 \times 10^{-23}$ e cm

Electric polarizability $\alpha = (12.0 \pm 0.6) \times 10^{-4}$ fm³

Magnetic polarizability $\beta = (1.9 \pm 0.5) \times 10^{-4}$ fm³

Charge radius = 0.877 ± 0.007 fm

Mean life $\tau > 2.1 \times 10^{29}$ years, CL = 90% [d] ($p \rightarrow$ invisible mode)

Mean life $\tau > 10^{31}$ to 10^{33} years [d] (mode dependent)

See the “Note on Nucleon Decay” in our 1994 edition (Phys. Rev. **D50**, 1173) for a short review.

The “partial mean life” limits tabulated here are the limits on τ/B_j , where τ is the total mean life and B_j is the branching fraction for the mode in question. For N decays, p and n indicate proton and neutron partial lifetimes.

<i>p</i> DECAY MODES	Partial mean life (10^{30} years)	Confidence level	<i>p</i> (MeV/c)
Antilepton + meson

NOTES

- [a] The masses of the p and n are most precisely known in u (unified atomic mass units). The conversion factor to MeV, $1\text{ u} = 931.494028(23)\text{ MeV}$, is less well known than are the masses in u.
- [b] The $|m_p - m_{\bar{p}}|/m_p$ and $|q_p + q_{\bar{p}}|/e$ are not independent, and both use the more precise measurement of $|q_{\bar{p}}/m_{\bar{p}}|/(q_p/m_p)$.
- [c] The limit is from neutrality-of-matter experiments; it assumes $q_n = q_p + q_e$. See also the charge of the neutron.
- [d] The first limit is for $p \rightarrow$ anything or "disappearance" modes of a bound proton. The second entry, a rough range of limits, assumes the dominant decay modes are among those investigated. For antiprotons the best limit, inferred from the observation of cosmic ray \bar{p} 's is $\tau_{\bar{p}} > 10^7$ yr, the cosmic-ray storage time, but this limit depends on a number of assumptions. The best direct observation of stored antiprotons gives $\tau_{\bar{p}}/B(\bar{p} \rightarrow e^- \gamma) > 7 \times 10^5$ yr.
- [e] There is some controversy about whether nuclear physics and model dependence complicate the analysis for bound neutrons (from which the best limit comes). The first limit here is from reactor experiments with free neutrons.
- [f] Lee and Yang in 1956 proposed the existence of a mirror world in an attempt to restore global parity symmetry—thus a search for oscillations between the two worlds. Oscillations between the worlds would be maximal when the magnetic fields B and B' were equal. The limit for any B' in the range 0 to $12.5\text{ }\mu\text{T}$ is $>12\text{ s}$ (95% CL).
- [g] The parameters g_A , g_V , and g_{WM} for semileptonic modes are defined by $\bar{B}_f[\gamma_\lambda(g_V + g_A\gamma_5) + i(g_{WM}/m_{B_i}) \sigma_{\lambda\nu} q^\nu]B_i$, and ϕ_{AV} is defined by $g_A/g_V = |g_A/g_V|e^{i\phi_{AV}}$. See the "Note on Baryon Decay Parameters" in the neutron Particle Listings.
- [h] Time-reversal invariance requires this to be 0° or 180° .
- [i] This coefficient is zero if time invariance is not violated.
- [j] This limit is for γ energies between 15 and 340 keV.
