

**$\Lambda(1520)$   $D_{03}$**  $I(J^P) = 0(\frac{3}{2}^-)$  Status: \*\*\*

Discovered by FERRO-LUZZI 62; the elaboration in WATSON 63 is the classic paper on the Breit-Wigner analysis of a multichannel resonance.

The measurements of the mass, width, and elasticity published before 1975 are now obsolete and have been omitted. They were last listed in our 1982 edition Physics Letters **111B** 1 (1982).

Production and formation experiments agree quite well, so they are listed together here.

## CONSTRAINED FIT INFORMATION

An overall fit to 9 branching ratios uses 26 measurements and one constraint to determine 6 parameters. The overall fit has a  $\chi^2 = 17.6$  for 21 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

 $\Gamma(\Sigma(1385)\pi(\rightarrow \Lambda\pi\pi))/\Gamma(\Lambda\pi\pi)$ 

The  $\Lambda\pi\pi$  mode is largely due to  $\Sigma(1385)\pi$ . Only the values of  $(\Sigma(1385)\pi) / (\Lambda\pi\pi)$  given by MAST 73B and CORDEN 75 are based on real 3-body partial-wave analyses. The discrepancy between the two results is essentially due to the different hypotheses made concerning the shape of the  $(\pi\pi)_S$ -wave state.

### $\Lambda(1520)$ FOOTNOTES

- <sup>1</sup> From the best-resolution sample of  $\Lambda\pi\pi$  events only.
- <sup>2</sup> The  $\bar{K}N \rightarrow \Sigma\pi$  amplitude at resonance is  $+0.46 \pm 0.01$ .
- <sup>3</sup> Assumes  $\Gamma(N\bar{K})/\Gamma_{\text{total}} = 0.46 \pm 0.02$ .
- <sup>4</sup> Both  $\Sigma(1385)\pi$   $DS_{03}$  and  $\Sigma(\pi\pi)$   $DP_{03}$  contribute.
- <sup>5</sup> The central bin (1514–1524 MeV) gives  $0.74 \pm 0.10$ ; other bins are lower by 2-to-5 standard deviations.
- <sup>6</sup> Much of the  $\Sigma\pi\pi$  decay proceeds via  $\Sigma(1385)\pi$ .
- <sup>7</sup> Assumes  $\Gamma(N\bar{K})/\Gamma_{\text{total}} = 0.46$ .
- <sup>8</sup> Calculated from  $\Gamma(\Lambda\gamma)/\Gamma_{\text{total}}$ , assuming SU(3). Needed to constrain the sum of all the branching ratios to be unity.
