## CPT INVARIANCE TESTS IN NEUTRAL KAON DECAY

Updated October 2009 by M. Antonelli (LNF-INFN, Frascati) and G. D'Ambrosio (INFN Sezione di Napoli).

CPT theorem is based on three assumptions: quantum field theory, locality, and Lorentz invariance, and thus it is a fundamental probe of our basic understanding of particle physics. Strangeness oscillation in  $K^0 - \overline{K}^0$  system, described by the equation

$$i\frac{d}{dt} \left[ \frac{K^0}{\overline{K}^0} \right] = \left[ M - i \Gamma/2 \right] \left[ \frac{K^0}{\overline{K}^0} \right] ,$$

where M and  $\Gamma$  are hermitian matrices (see PDG review [1], references [2,3], and KLOE paper [4] for notations and previous literature), allows a very accurate test of CPT symmetry; indeed since CPT requires  $M_{11} = M_{22}$  and  $\Gamma_{11} = \Gamma_{22}$ , the mass and width eigenstates,  $K_{S,L}$ , have a CPT-violating piece,  $\delta$ , in addition to the usual CPT-conserving parameter  $\epsilon$ :

$$K_{S,L} = \frac{1}{\sqrt{2\left(1 + |\epsilon_{S,L}|^2\right)}} \left[ \left(1 + \epsilon_{S,L}\right) K^0 + \left(1 - \epsilon_{S,L}\right) \overline{K}^0 \right]$$

$$\epsilon_{S,L} = \frac{-i\Im(M_{12}) - \frac{1}{2}\Im(\Gamma_{12}) \mp \frac{1}{2} \left[ M_{11} - M_{22} - \frac{i}{2} (\Gamma_{11} - \Gamma_{22}) \right]}{m_L - m_S + i(\Gamma_S - \Gamma_L)/2}$$

$$\equiv \epsilon \pm \delta. \tag{1}$$

Using the phase convention  $\Im(\Gamma_{12}) = 0$ , we determine the phase of  $\epsilon$  to be  $\varphi_{SW} \equiv \arctan \frac{2(m_L - m_S)}{\Gamma_S - \Gamma_L}$ . Imposing unitarity to an arbitrary combination of  $K^0$  and  $\overline{K}^0$  wave functions, we obtain the Bell-Steinberger relation [5] connecting CP and CPT violation in the mass matrix to CP and CPT violation in the decay; in fact, neglecting  $\mathcal{O}(\epsilon)$  corrections to the coefficient of the CPT-violating parameter,  $\delta$ , we can write [4]

$$\left[\frac{\Gamma_S + \Gamma_L}{\Gamma_S - \Gamma_L} + i \tan \phi_{\text{SW}}\right] \left[\frac{\Re(\epsilon)}{1 + |\epsilon|^2} - i\Im(\delta)\right] = \frac{1}{\Gamma_S - \Gamma_L} \sum_f A_L(f) A_S^*(f), \tag{2}$$

where  $A_{L,S}(f) \equiv A(K_{L,S} \to f)$ . We stress that this relation is phase-convention-independent. The advantage of the neutral kaon system is that only a few decay modes give significant contributions to the r.h.s. in Eq. (2); in fact, defining for the hadronic modes

$$\alpha_i \equiv \frac{1}{\Gamma_S} \langle \mathcal{A}_L(i) \mathcal{A}_S^*(i) \rangle = \eta_i \ \mathcal{B}(K_S \to i),$$

$$i = \pi^0 \pi^0, \pi^+ \pi^-(\gamma), 3\pi^0, \pi^0 \pi^+ \pi^-(\gamma),$$
(3)

the recent data from CPLEAR, KLOE, KTeV, and NA48 have led to the following determinations (the analysis described in Ref. 4 has been updated by using the recent measurements of  $K_L$  branching ratios from KTeV [6] and NA48 [7,8])

$$\alpha_{\pi^{+}\pi^{-}} = ((1.112 \pm 0.013) + i(1.061 \pm 0.014)) \times 10^{-3} ,$$

$$\alpha_{\pi^{0}\pi^{0}} = ((0.493 \pm 0.007) + i(0.471 \pm 0.007)) \times 10^{-3} ,$$

$$\alpha_{\pi^{+}\pi^{-}\pi^{0}} = ((0 \pm 2) + i(0 \pm 2)) \times 10^{-6} ,$$

$$|\alpha_{\pi^{0}\pi^{0}\pi^{0}}| < 7 \times 10^{-6} \text{ at } 95\% \text{ CL} .$$

$$(4)$$

The semileptonic contribution to the right-handed side of Eq. (2) requires the determination of several observables: we define [2,3]

$$\mathcal{A}(K^{0} \to \pi^{-}l^{+}\nu) = \mathcal{A}_{0}(1-y) ,$$

$$\mathcal{A}(K^{0} \to \pi^{+}l^{-}\nu) = \mathcal{A}_{0}^{*}(1+y^{*})(x_{+}-x_{-})^{*} ,$$

$$\mathcal{A}(\overline{K}^{0} \to \pi^{+}l^{-}\nu) = \mathcal{A}_{0}^{*}(1+y^{*}) ,$$

$$\mathcal{A}(\overline{K}^{0} \to \pi^{-}l^{+}\nu) = \mathcal{A}_{0}(1-y)(x_{+}+x_{-}) ,$$
(5)

where  $x_+$   $(x_-)$  describes the violation of the  $\Delta S = \Delta Q$  rule in CPT-conserving (violating) decay amplitudes, and y parametrizes CPT violation for  $\Delta S = \Delta Q$  transitions. Taking advantage of their tagged  $K^0(\overline{K}^0)$  beams, CPLEAR has measured  $\Im(x_+)$ ,  $\Re(x_-)$ ,  $\Im(\delta)$ , and  $\Re(\delta)$  [10]. These determinations have been improved in Ref. 4 by including the information  $A_S - A_L = 4[\Re(\delta) + \Re(x_-)]$ , where  $A_{L,S}$  are the  $K_L$  and  $K_S$  semileptonic charge asymmetries, respectively, from the PDG [11] and KLOE [12]. Here we are also including the T-violating asymmetry measurement from CPLEAR [13].

**Table 1:** Values, errors, and correlation coefficients for  $\Re(\delta)$ ,  $\Im(\delta)$ ,  $\Re(x_{-})$ ,  $\Im(x_{+})$ , and  $A_{S} + A_{L}$  obtained from a combined fit, including KLOE [4] and CPLEAR [13].

	value	Correlations coefficients
$\Re(\delta)$	$(3.0 \pm 2.3) \times 10^{-4}$	1
$\Im(\delta)$	$(-0.66 \pm 0.65) \times 10^{-2}$	-0.21 1
$\Re(x)$	$(-0.30 \pm 0.21) \times 10^{-2}$	-0.21 $-0.60$ 1
$\Im(x_+)$	$(0.02 \pm 0.22) \times 10^{-2}$	-0.38 $-0.14$ $0.47$ $1$
$A_S + A_L$	$(-0.40 \pm 0.83) \times 10^{-2}$	-0.10 $-0.63$ $0.99$ $0.43$ $1$

The value  $A_S + A_L$  in Table 1 can be directly included in the semileptonic contributions to the Bell Steinberger relations in Eq. (2)

$$\sum_{\pi\ell\nu} \langle \mathcal{A}_L(\pi\ell\nu) \mathcal{A}_S^*(\pi\ell\nu) \rangle$$

$$= 2\Gamma(K_L \to \pi\ell\nu)(\Re(\epsilon) - \Re(y) - i(\Im(x_+) + \Im(\delta)))$$

$$= 2\Gamma(K_L \to \pi\ell\nu)((A_S + A_L)/4 - i(\Im(x_+) + \Im(\delta))) . (6)$$

Defining

$$\alpha_{\pi\ell\nu} \equiv \frac{1}{\Gamma_S} \sum_{\pi\ell\nu} \langle \mathcal{A}_L(\pi\ell\nu) \mathcal{A}_S^*(\pi\ell\nu) \rangle + 2i \frac{\tau_{K_S}}{\tau_{K_L}} \mathcal{B}(K_L \to \pi\ell\nu) \Im(\delta) ,$$
(7)

we find:

$$\alpha_{\pi\ell\nu} = ((-0.2 \pm 0.5) + i(0.1 \pm 0.5)) \times 10^{-5}$$
.

Inserting the values of the  $\alpha$  parameters into Eq. (2), we find

$$\Re(\epsilon) = (161.2 \pm 0.6) \times 10^{-5},$$

$$\Im(\delta) = (-0.6 \pm 1.9) \times 10^{-5}.$$
(8)

The complete information on Eq. (8) is given in Table 2.

**Table 2:** Summary of results: values, errors, and correlation coefficients for  $\Re(\epsilon)$ ,  $\Im(\delta)$ ,  $\Re(\delta)$ , and  $\Re(x_{-})$ .

	value	Correlations coefficients
$\Re(\epsilon)$	$(161.2 \pm 0.6) \times 10^{-5}$	+1
$\Im(\delta)$	$(-0.6 \pm 1.9) \times 10^{-5}$	+0.26 1
$\Re(\delta)$	$(2.5 \pm 2.3) \times 10^{-4}$	+0.08 -0.09 1
$\Re(x)$	$(-4.2 \pm 1.7) \times 10^{-3}$	+0.13  0.17  -0.43  1

Now the agreement with CPT conservation,  $\Im(\delta) = \Re(\delta) = \Re(x_{-}) = 0$ , is at 30% C.L.

The allowed region in the  $\Re(\epsilon) - \Im(\delta)$  plane at 68% CL and 95% C.L. is shown in the top panel of Fig. 1.

The process giving the largest contribution to the size of the allowed region is  $K_L \to \pi^+\pi^-$ , through the uncertainty on  $\phi_{+-}$ .

The limits on  $\Im(\delta)$  and  $\Re(\delta)$  can be used to constrain the  $K^0-\overline{K}^0$  mass and width difference

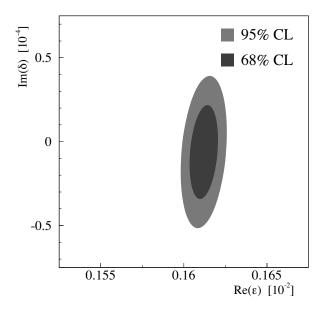

$$\delta = \frac{i(m_{K^0} - m_{\overline{K}^0}) + \frac{1}{2}(\Gamma_{K^0} - \Gamma_{\overline{K}^0})}{\Gamma_S - \Gamma_L} \cos \phi_{SW} e^{i\phi_{SW}} [1 + \mathcal{O}(\epsilon)].$$

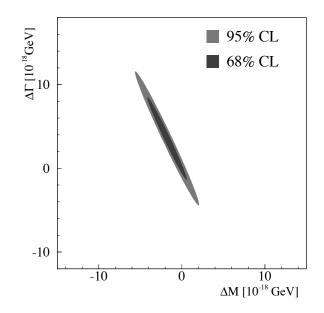

The allowed region in the  $\Delta M=(m_{K^0}-m_{\overline{K}^0}), \Delta \Gamma=(\Gamma_{K^0}-\Gamma_{\overline{K}^0})$  plane is shown in the bottom panel of Fig. 1. As a result, we improve on the previous limits (see for instance, P. Bloch in Ref. 11) and in the limit  $\Gamma_{K^0}-\Gamma_{\overline{K}^0}=0$  we obtain

$$-5.1 \times 10^{-19} \ {\rm GeV} < m_{K^0} - m_{\overline{K}^0} < 5.1 \times 10^{-19} \ {\rm GeV} \ {\rm at} \ 95 \ \% \ {\rm C.L} \, .$$

Adding the preliminary KTeV results on  $\phi_{\pi^+\pi^-}$  and  $\Delta\phi$  [14,15] we obtain:  $\Re(\epsilon) = (161.2 \pm 0.6) \times 10^{-5}$ ,  $\Im(\delta) = (-0.6 \pm 1.4) \times 10^{-5}$ , leading to

$$-4.0\times 10^{-19}~{\rm GeV} < m_{K^0} - m_{\overline{K}^0} < 4.0\times 10^{-19}~{\rm GeV}~{\rm at}~95~\%~{\rm C.L}\,.$$

**Figure 1:** Top: allowed region at 68% and 95% C.L. in the  $\Re(\epsilon)$ ,  $\Im(\delta)$  plane. Bottom: allowed region at 68% and 95% C.L. in the  $\Delta M, \Delta \Gamma$  plane. Latest KTeV preliminary results not included in these figures.
