μ

$J = \frac{1}{2}$

μ MASS (atomic mass units u)

The muon's mass is obtained from the muon-electron mass ratio as determined from the measurement of Zeeman transition frequencies in muonium ($\mu^+ e^-$ atom). Since the electron's mass is most accurately known in u, the muon's mass is also most accurately known in u. The conversion factor to MeV has approximately the same relative uncertainty as the mass of the muon in u. In this datablock we give the result in u, and in the following datablock in MeV.

μ MASS

2010 CODATA (MOHR 12) gives the conversion factor from u (atomic mass units, see the above datablock) to MeV as 931.494 061 (21). Earlier values use the then-current conversion factor. The conversion error contributes significantly to the uncertainty of the masses given below.

μ/p MAGNETIC MOMENT RATIO

This ratio is used to obtain a precise value of the muon mass and to reduce experimental muon Larmor frequency measurements to the muon magnetic moment anomaly. Measurements with an error > 0.00001 have been omitted. By convention, the minus sign on this ratio is omitted. CODATA values were fitted using their selection of data, plus other data from multiparameter fits.

μ MAGNETIC MOMENT ANOMALY

The parity-violating decay of muons in a storage ring is observed. The difference frequency ω_a between the muon spin precision and the orbital angular frequency $(e/m_\mu c)\langle B\rangle$ is measured, as is the free proton NMR frequency ω_p, thus determining the ratio $R{=}\omega_a/\omega_p$. Given the magnetic moment ratio $\lambda{=}\mu_\mu/\mu_p$ (from hyperfine structure in muonium), $(g{-}2)/2 = R/(\lambda{-}R)$.

$\mu_\mu/(e\hbar/2m_\mu)-1 = (g_\mu-2)/2$

μ^- DECAY MODES

μ^+ modes are charge conjugates of the modes below.

	Mode			Fraction (Γ_i/Γ)		Confidence level
Γ_1	$e^- \overline{\nu}_e \nu_\mu$			$\approx 100\%$		
Γ_2	$e^- \overline{\nu}_e \nu_\mu \gamma$		[a]	(1.4 ± 0.4) %		
Γ_3	$e^- \overline{\nu}_e \nu_\mu e^+ e^-$		[b]	$(3.4 \pm 0.4) \times 10^{-5}$		
	Lepton Family number (LF) violating modes					
Γ_4	$e^- \nu_e \overline{\nu}_\mu$	LF	[c]	< 1.2	%	90%
Γ_5	$e^- \gamma$	LF		< 5.7	$\times 10^{-13}$	90%
Γ_6	$e^- e^+ e^-$	LF		< 1.0	$\times 10^{-12}$	90%
Γ_7	$e^- 2\gamma$	LF		< 7.2	$\times 10^{-11}$	90%

[a] This only includes events with the γ energy > 10 MeV. Since the $e^- \overline{\nu}_e \nu_\mu$ and $e^- \overline{\nu}_e \nu_\mu \gamma$ modes cannot be clearly separated, we regard the latter mode as a subset of the former.

[b] See the Particle Listings below for the energy limits used in this measurement.

[c] A test of additive vs. multiplicative lepton family number conservation.

$<1.7 \times 10^{-10}$	90		[27] AHMAD	88	TPC		TRIUMF

[24] This limit assumes a giant resonance excitation of the daughter Ca nucleus (mean energy and width both 20 MeV).

[25] KAULARD 98 obtained these same limits using the unified classical analysis of FELDMAN 98.

[26] This limit assumes the daughter Ca nucleus is left in the ground state. However, the probability of this is unknown.

[27] Assuming a giant-resonance-excitation model.

LIMIT ON MUONIUM → ANTIMUONIUM CONVERSION

Forbidden by lepton family number conservation.

$R_g = G_C / G_F$

The effective Lagrangian for the $\mu^+ e^- \to \mu^- e^+$ conversion is assumed to be

$$\mathcal{L} = 2^{-1/2}\, G_C\, [\overline{\psi}_\mu \gamma_\lambda\, (1 - \gamma_5)\, \psi_e]\, [\overline{\psi}_\mu \gamma_\lambda\, (1 - \gamma_5)\, \psi_e] + \text{h.c.}$$

The experimental result is then an upper limit on G_C/G_F, where G_F is the Fermi coupling constant.

>0.99682	90	[46] JODIDIO	86	SPEC	+	TRIUMF
>0.9966	90	[47] STOKER	85	SPEC	+	μ-spin rotation
>0.9959	90	CARR	83	SPEC	+	11 kG

[45] BAYES 11 obtains the limit > 0.99909 (90% CL) with the constraint that $\xi \times$(μ LONGITUDINAL POLARIZATION) $\times \delta/\rho \leq 1.0$.

[46] JODIDIO 86 includes data from CARR 83 and STOKER 85. The value here is from the erratum.

[47] STOKER 85 find ($\xi P_\mu \delta/\rho$) $>$0.9955 and $>$0.9966, where the first limit is from new μ spin-rotation data and the second is from combination with CARR 83 data. In $V-A$ theory, $(\delta/\rho) = 1.0$.

ξ' = LONGITUDINAL POLARIZATION OF e^+

($V-A$) theory predicts the longitudinal polarization $= \pm 1$ for $e^{\pm}$, respectively. We have flipped the sign for e^- so our programs can average.
