

# $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE

## $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE MEAN LIFE

Each measurement of the  $B$  mean life is an average over an admixture of various bottom mesons and baryons which decay weakly. Different techniques emphasize different admixtures of produced particles, which could result in a different  $B$  mean life.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at <http://www.slac.stanford.edu/xorg/hfag/>. This is a weighted average of the lifetimes of the five main  $b$ -hadron species ( $B^+$ ,  $B^0$ ,  $B_{sH}^0$ ,  $B_{sL}^0$ , and  $\Lambda_b$ ) that assumes the production fractions in  $Z$  decays (given at the end of this section) and equal production fractions of  $B_{sH}^0$  and  $B_{sL}^0$  mesons.

<sup>1</sup> Measurement performed using an inclusive reconstruction and  $B$  flavor identification technique.

<sup>2</sup> Measured using inclusive  $J/\psi(1S) \rightarrow \mu^+ \mu^-$  vertex.

<sup>3</sup> ACCIARRI 98 uses inclusively reconstructed secondary vertex and lepton impact parameter.

<sup>4</sup> ACKERSTAFF 97F uses inclusively reconstructed secondary vertices.

<sup>5</sup> Combines ABREU 96E secondary vertex result with ABREU 94L impact parameter result.

<sup>6</sup> BUSKULIC 96F analyzed using 3D impact parameter.

<sup>7</sup> ABE,K 95B uses an inclusive topological technique.

<sup>8</sup> ABREU 94L uses charged particle impact parameters. Their result from inclusively reconstructed secondary vertices is superseded by ABREU 96E.

<sup>9</sup> From proper time distribution of  $b \rightarrow J/\psi(1S)\text{anything}$ .

<sup>10</sup> ABE 93J analyzed using  $J/\psi(1S) \rightarrow \mu\mu$  vertices.

<sup>11</sup> ABREU 93D data analyzed using  $D/D^*\ell\text{anything}$  event vertices.

<sup>12</sup> ABREU 93G data analyzed using charged and neutral vertices.

<sup>13</sup> ACTON 93C analysed using  $D/D^*\ell\text{anything}$  event vertices.

<sup>14</sup> ACTON 93L and ADRIANI 93K analyzed using lepton ( $e$  and  $\mu$ ) impact parameter at  $Z$ .

<sup>15</sup> BUSKULIC 93O analyzed using dipole method.

<sup>16</sup> ABREU 92 is combined result of muon and hadron impact parameter analyses. Hadron tracks gave  $(12.7 \pm 0.4 \pm 1.2) \times 10^{-13} \text{ s}$  for an admixture of  $B$  species weighted by production fraction and mean charge multiplicity, while muon tracks gave  $(13.0 \pm 1.0 \pm 0.8) \times 10^{-13} \text{ s}$  for an admixture weighted by production fraction and semileptonic branching fraction.

<sup>17</sup> ACTON 92 is combined result of muon and electron impact parameter analyses.

<sup>18</sup> BUSKULIC 92F uses the lepton impact parameter distribution for data from the 1991 run.

<sup>19</sup> BUSKULIC 92G use  $J/\psi(1S)$  tags to measure the average  $b$  lifetime. This is comparable to other methods only if the  $J/\psi(1S)$  branching fractions of the different  $b$ -flavored hadrons are in the same ratio.

<sup>20</sup> Using  $Z \rightarrow e^+ X$  or  $\mu^+ X$ , ADEVA 91H determined the average lifetime for an admixture of  $B$  hadrons from the impact parameter distribution of the lepton.

<sup>21</sup> Using  $Z \rightarrow J/\psi(1S)X$ ,  $J/\psi(1S) \rightarrow \ell^+ \ell^-$ , ALEXANDER 91G determined the average lifetime for an admixture of  $B$  hadrons from the decay point of the  $J/\psi(1S)$ .

<sup>22</sup> Using  $Z \rightarrow eX$  or  $\mu X$ , DECOMP 91C determines the average lifetime for an admixture of  $B$  hadrons from the signed impact parameter distribution of the lepton.

<sup>23</sup> HAGEMANN 90 uses electrons and muons in an impact parameter analysis.

<sup>24</sup> LYONS 90 combine the results of the  $B$  lifetime measurements of ONG 89, BRAUN-SCHWEIG 89B, KLEM 88, and ASH 87, and JADE data by private communication. They use statistical techniques which include variation of the error with the mean life, and possible correlations between the systematic errors. This result is not independent of the measured results used in our average.

<sup>25</sup> We have combined an overall scale error of 15% in quadrature with the systematic error of  $\pm 0.7$  to obtain  $\pm 2.1$  systematic error.

<sup>26</sup> Statistical and systematic errors were combined by BROM 87.

## $\bar{b}$ PRODUCTION FRACTIONS AND DECAY MODES

The branching fraction measurements are for an admixture of  $B$  mesons and baryons at energies above the  $\Upsilon(4S)$ . Only the highest energy results (LHC, LEP, Tevatron,  $Spp\bar{S}$ ) are used in the branching fraction averages. In the following, we assume that the production fractions are the same at the LHC, LEP, and at the Tevatron.

For inclusive branching fractions, *e.g.*,  $B \rightarrow D^\pm$  anything, the values usually are multiplicities, not branching fractions. They can be greater than one.

The modes below are listed for a  $\bar{b}$  initial state.  $b$  modes are their charge conjugates. Reactions indicate the weak decay vertex and do not include mixing.

| Mode | Fraction ( $\Gamma_i/\Gamma$ ) | Scale factor/<br>Confidence level |
|------|--------------------------------|-----------------------------------|
|------|--------------------------------|-----------------------------------|

## PRODUCTION FRACTIONS

The production fractions for weakly decaying  $b$ -hadrons at high energy have been calculated from the best values of mean lives, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFAG) as described in the note “ $B^0$ - $\bar{B}^0$  Mixing” in the  $B^0$  Particle Listings. The production fractions in  $b$ -hadronic  $Z$  decay or  $p\bar{p}$  collisions at the Tevatron are also listed at the end of the section. Values assume

$$\begin{aligned} B(\bar{b} \rightarrow B^+) &= B(\bar{b} \rightarrow B^0) \\ B(\bar{b} \rightarrow B^+) + B(\bar{b} \rightarrow B^0) + B(\bar{b} \rightarrow B_s^0) + B(b \rightarrow b\text{-baryon}) &= 100\%. \end{aligned}$$

The correlation coefficients between production fractions are also reported:

$$\begin{aligned} \text{cor}(B_s^0, b\text{-baryon}) &= -0.240 \\ \text{cor}(B_s^0, B^\pm = B^0) &= -0.161 \\ \text{cor}(b\text{-baryon}, B^\pm = B^0) &= -0.920. \end{aligned}$$

The notation for production fractions varies in the literature ( $f_d$ ,  $d_{B^0}$ ,  $f(b \rightarrow \bar{B}^0)$ ,  $\text{Br}(b \rightarrow \bar{B}^0)$ ). We use our own branching fraction notation here,  $B(\bar{b} \rightarrow B^0)$ .

Note these production fractions are  $b$ -hadronization fractions, not the conventional branching fractions of  $b$ -quark to a  $B$ -hadron, which may have considerable dependence on the initial and final state kinematic and production environment.

|            |             |                      |
|------------|-------------|----------------------|

[a] An  $\ell$  indicates an  $e$  or a  $\mu$  mode, not a sum over these modes.

[b]  $D_j$  represents an unresolved mixture of pseudoscalar and tensor  $D^{**}$  ( $P$ -wave) states.

[c] The value is for the sum of the charge states or particle/antiparticle states indicated.

[d] Inclusive branching fractions have a multiplicity definition and can be greater than 100%.

**$B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE BRANCHING RATIOS** **$\Gamma(B^+)/\Gamma_{\text{total}}$**  **$\Gamma_1/\Gamma$** 

"OUR EVALUATION" is an average using rescaled values of the data listed below and from the best values of mean lives, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFAG) as described at <http://www.slac.stanford.edu/xorg/hfag/>.

| 0.213           | ± 0.068            | <sup>4</sup> AFFOLDER | 00E CDF  | $p\bar{p}$ at 1.8 TeV  |
| 0.21            | ± 0.036            | <sup>5</sup> ABE      | 99P CDF  | $\bar{p}p$ at 1.8 TeV  |

<sup>1</sup> Measured using  $b$ -hadron semileptonic decays and assuming isospin symmetry.

<sup>2</sup> AAIJ 11F measured  $f_s/f_d = 0.253 \pm 0.017 \pm 0.017 \pm 0.020$ , where the errors are statistical, systematic, and theoretical. We divide their value by 2. Our second error combines systematic and theoretical uncertainties.

<sup>3</sup> AALTONEN 08N reports  $[\Gamma(\bar{b} \rightarrow B_s^0)/[\Gamma(\bar{b} \rightarrow B^+) + \Gamma(\bar{b} \rightarrow B^0)]] \times [B(D_s^+ \rightarrow \phi\pi^+)] = (5.76 \pm 0.18^{+0.45}_{-0.42}) \times 10^{-3}$  which we divide by our best value  $B(D_s^+ \rightarrow \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup> AFFOLDER 00E uses several electron-charm final states in  $b \rightarrow ce^- X$ .

<sup>5</sup> ABE 99P uses the numbers of  $K^*(892)^0$ ,  $K^*(892)^+$ , and  $\phi(1020)$  events produced in association with the double semileptonic decays  $b \rightarrow c\mu^- X$  with  $c \rightarrow s\mu^+ X$ .

 **$\Gamma(B_s^0)/\Gamma(B^0)$**  **$\Gamma_3/\Gamma_2$**

| <b>0.256 ± 0.014 OUR EVALUATION</b> |             |      |         |

**0.239 ± 0.016 OUR AVERAGE**

|                               |                   |            |                     |
|-------------------------------|-------------------|------------|---------------------|
| 0.240 ± 0.004 ± 0.020         | <sup>1</sup> AAD  | 15CM ATLAS | $p\bar{p}$ at 7 TeV |
| 0.238 ± 0.004 ± 0.015 ± 0.021 | <sup>2</sup> AAIJ | 13P LHCb   | $p\bar{p}$ at 7 TeV |

<sup>1</sup> The measurement is derived from the observed  $B_s^0 \rightarrow J/\psi\phi$  and  $B_d^0 \rightarrow J/\psi K^{*0}$  yields and a recent theory prediction of  $B(B_s^0 \rightarrow J/\psi\phi)/B(B_d^0 \rightarrow J/\psi K^{*0})$ . The second uncertainty combines in quadrature systematic and theoretical uncertainties.

<sup>2</sup> AAIJ 13P studies also separately the  $p_T(B)$  and  $\eta(B)$  dependency of  $\Gamma(\bar{b} \rightarrow B_s^0)/\Gamma(\bar{b} \rightarrow B^0)$ , finding  $f_s/f_d(p_T) = (0.256 \pm 0.020) + (-2.0 \pm 0.6) 10^{-3}$  /GeV/c ( $p_T - \langle p_T \rangle$ ) and  $f_s/f_d(\eta) = (0.256 \pm 0.020) + (0.005 \pm 0.006) (\eta - \langle \eta \rangle)$ , where  $\langle p_T \rangle = 10.4$  GeV/c and  $\langle \eta \rangle = 3.28$ .

| $0.100 \pm 0.007 \pm 0.007$    | <sup>9</sup> ABREU    | 93C | DLPH | $e^+ e^- \rightarrow Z$ |
| $0.105 \pm 0.006 \pm 0.005$    | <sup>10</sup> AKERS   | 93B | OPAL | Repl. by ABBIENDI 00E   |

<sup>1</sup> Uses the combination of lepton transverse momentum spectrum and the correlation between the charge of the lepton and opposite jet charge. The first error is statistic and the second error is the total systematic error including the modeling.

<sup>2</sup> The experimental systematic and model uncertainties are combined in quadrature.

<sup>3</sup> ABBIENDI 00E result is determined by comparing the distribution of several kinematic variables of leptonic events in a lifetime tagged  $Z \rightarrow b\bar{b}$  sample using artificial neural network techniques. The first error is statistic; the second error is the total systematic error.

<sup>4</sup> ACCIARRI 00 result obtained from a combined fit of  $R_B = \Gamma(Z \rightarrow b\bar{b})/\Gamma(Z \rightarrow \text{hadrons})$  and  $B(b \rightarrow \ell\nu X)$ , using double-tagging method.

<sup>5</sup> ACCIARRI 96C result obtained by a fit to the single lepton spectrum.

<sup>6</sup> Assumes Standard Model value for  $R_B$ .

<sup>7</sup> ABREU 95D give systematic errors  $\pm 0.0019$  (model) and  $0.0012$  ( $R_C$ ). We combine these in quadrature.

<sup>8</sup> BUSKULIC 94G uses  $e$  and  $\mu$  events. This value is from a global fit to the lepton  $p$  and  $p_T$  (relative to jet) spectra which also determines the  $b$  and  $c$  production fractions, the fragmentation functions, and the forward-backward asymmetries. This branching ratio depends primarily on the ratio of dileptons to single leptons at high  $p_T$ , but the lower  $p_T$  portion of the lepton spectrum is included in the global fit to reduce the model dependence. The model dependence is  $\pm 0.0026$  and is included in the systematic error.

<sup>9</sup> ABREU 93C event count includes  $ee$  events. Combining  $ee$ ,  $\mu\mu$ , and  $e\mu$  events, they obtain  $0.100 \pm 0.007 \pm 0.007$ .

<sup>10</sup> AKERS 93B analysis performed using single and dilepton events.

<sup>1</sup> ABBIENDI 00E result is determined by comparing the distribution of several kinematic variables of leptonic events in a lifetime tagged  $Z \rightarrow b\bar{b}$  sample using artificial neural network techniques. The first error is statistic; the second error is the total systematic error.

<sup>2</sup> ACCIARRI 96C result obtained by a fit to the single lepton spectrum.

<sup>3</sup> Assumes Standard Model value for  $R_B$ .

<sup>4</sup> ABREU 93C event count includes  $ee$  events. Combining  $ee$ ,  $\mu\mu$ , and  $e\mu$  events, they obtain  $0.100 \pm 0.007 \pm 0.007$ .

<sup>5</sup> ADEVA 91C measure the average  $B(b \rightarrow eX)$  branching ratio using single and double tagged  $b$  enhanced  $Z$  events. Combining  $e$  and  $\mu$  results, they obtain  $0.113 \pm 0.010 \pm 0.006$ . Constraining the initial number of  $b$  quarks by the Standard Model prediction ( $378 \pm 3$  MeV) for the decay of the  $Z$  into  $b\bar{b}$ , the electron result gives  $0.112 \pm 0.004 \pm 0.008$ . They obtain  $0.119 \pm 0.003 \pm 0.006$  when  $e$  and  $\mu$  results are combined. Used to measure the  $b\bar{b}$  width itself, this electron result gives  $370 \pm 12 \pm 24$  MeV and combined with the muon result gives  $385 \pm 7 \pm 22$  MeV.

<sup>6</sup> ABE 93E experiment also measures forward-backward asymmetries and fragmentation functions for  $b$  and  $c$ .

<sup>7</sup> AKERS 93B analysis performed using single and dilepton events.

<sup>1</sup> ABBIENDI 01Q uses a missing energy technique.

<sup>2</sup> The energy-flow and  $b$ -tagging algorithms were used.

<sup>3</sup> Uses the missing energy in  $Z \rightarrow b\bar{b}$  decays without identifying leptons.

<sup>4</sup> ACCIARRI 96C result obtained from missing energy spectrum.

<sup>5</sup> Assumes Standard Model value for  $R_B$ .

<sup>6</sup> This is a direct result using tagged  $b\bar{b}$  events at the  $Z$ , but species are not separated.

<sup>7</sup> BUSKULIC 95 uses missing-energy technique.

<sup>1</sup> Uses the combination of lepton transverse momentum spectrum and the correlation between the charge of the lepton and opposite jet charge. The first error is statistic and the second error is the total systematic error including the modeling.

<sup>2</sup> The experimental systematic and model uncertainties are combined in quadrature.

<sup>3</sup> ABBIENDI 00E result is determined by comparing the distribution of several kinematic variables of leptonic events in a lifetime tagged  $Z \rightarrow b\bar{b}$  sample using artificial neural network techniques. The first error is statistic; the second error is the total systematic error.

<sup>4</sup> ABREU 95D give systematic errors  $\pm 0.0033$  (model) and  $0.0032 (R_C)$ . We combine these in quadrature. This result is from the same global fit as their  $\Gamma(\bar{b} \rightarrow \ell^+ \bar{\nu}_\ell X)$  data.

<sup>5</sup> BUSKULIC 94G uses  $e$  and  $\mu$  events. This value is from the same global fit as their  $\Gamma(\bar{b} \rightarrow \ell^+ \bar{\nu}_\ell \text{anything})/\Gamma_{\text{total}}$  data.

<sup>6</sup> AKERS 93B analysis performed using single and dilepton events.

<sup>1</sup> Measurement performed using an inclusive identification of  $B$  mesons and the  $D$  candidates.

<sup>2</sup> Evaluated via summation of exclusive and inclusive channels.

<sup>3</sup> ABREU 98D results are extracted from a fit to the  $b$ -tagging probability distribution based on the impact parameter.

<sup>4</sup> BUSKULIC 96Y assumes PDG 96 production fractions for  $B^0$ ,  $B^+$ ,  $B_s$ ,  $b$  baryons, and PDG 96 branching ratios for charm decays. This is sum of their inclusive  $\bar{D}^0$ ,  $D^-$ ,  $\bar{D}_s^-$ , and  $\Lambda_c$  branching ratios, corrected to include inclusive  $\Xi_c$  and charmonium.

 $\chi_b$  AT HIGH ENERGY

For a discussion of  $B\bar{B}$  mixing, see the note on “ $B^0\bar{B}^0$  Mixing” in the  $B^0$  Particle Listings.

$\chi_b$  is the average  $B\bar{B}$  mixing parameter at high-energy  $\chi_b = f'_d \chi_d + f'_s \chi_s$  where  $f'_d$  and  $f'_s$  are the fractions of  $B^0$  and  $B_s^0$  hadrons in an unbiased sample of semileptonic  $b$ -hadron decays.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFAG) and are described at <http://www.slac.stanford.edu/xorg/hfag/>. The averaging/rescaling procedure takes into account correlations between the measurements.

<sup>1</sup> Uses the dimuon charge asymmetry. Averaged over the mix of *b*-flavored hadrons.

<sup>2</sup> Measurement performed using events containing a dimuon or an  $e/\mu$  pair.

<sup>3</sup> The average *B* mixing parameter is determined simultaneously with *b* and *c* forward-backward asymmetries in the fit.

<sup>4</sup> The experimental systematic and model uncertainties are combined in quadrature.

<sup>5</sup> ACCIARRI 99D uses maximum-likelihood fits to extract  $\chi_B$  as well as the  $A_{FB}^b$  in  $Z \rightarrow b\bar{b}$  events containing prompt leptons.

<sup>6</sup> This ABREU 94J result is from 5182  $\ell\ell$  and 279  $\Lambda\ell$  events. The systematic error includes 0.004 for model dependence.

<sup>7</sup> BUSKULIC 94G data analyzed using  $ee$ ,  $e\mu$ , and  $\mu\mu$  events.

<sup>8</sup> BUSKULIC 92B uses a jet charge technique combined with electrons and muons.

<sup>9</sup> ABE 91G measurement of  $\chi$  is done with  $e\mu$  and  $ee$  events.

<sup>10</sup> ALBAJAR 91D measurement of  $\chi$  is done with dimuons.

<sup>11</sup> Uses di-muon events.

<sup>12</sup> ALEXANDER 96 uses a maximum likelihood fit to simultaneously extract  $\chi$  as well as the forward-backward asymmetries in  $e^+ e^- \rightarrow Z \rightarrow b\bar{b}$  and  $c\bar{c}$ .

<sup>13</sup> UENO 96 extracted  $\chi$  from the energy dependence of the forward-backward asymmetry.

- <sup>14</sup> ABREU 94F uses the average electric charge sum of the jets recoiling against a  $b$ -quark jet tagged by a high  $p_T$  muon. The result is for  $\bar{\chi} = f_d \chi_d + 0.9 f_s \chi_s$ .
- <sup>15</sup> This ABREU 94J result combines  $\ell\ell$ ,  $\Lambda\ell$ , and jet-charge  $\ell$  (ABREU 94F) analyses. It is for  $\bar{\chi} = f_d \chi_d + 0.96 f_s \chi_s$ .
- <sup>16</sup> ALBAJAR 94 uses dimuon events. Not independent of ALBAJAR 91D.
- <sup>17</sup> ABREU 93C data analyzed using  $ee$ ,  $e\mu$ , and  $\mu\mu$  events.
- <sup>18</sup> AKERS 93B analysis performed using dilepton events.
- <sup>19</sup> ACTON 92C uses electrons and muons. Superseded by AKERS 93B.
- <sup>20</sup> ADEVA 92C uses electrons and muons.
- <sup>21</sup> DECAMP 91 done with opposite and like-sign dileptons. Superseded by BUSKULIC 92B.
- <sup>22</sup> ADEVA 90P measurement uses  $ee$ ,  $\mu\mu$ , and  $e\mu$  events from 118k events at the  $Z$ . Superseded by ADEVA 92C.
- <sup>23</sup> These experiments are not in the average because the combination of  $B_s$  and  $B_d$  mesons which they see could differ from those at higher energy.
- <sup>24</sup> The WEIR 90 measurement supersedes the limit obtained in SCHAAD 85. The 90% CL are 0.06 and 0.38.
- <sup>25</sup> ALBAJAR 87C measured  $\chi = (\bar{B}^0 \rightarrow B^0 \rightarrow \mu^+ X)$  divided by the average production weighted semileptonic branching fraction for  $B$  hadrons at 546 and 630 GeV.
- <sup>26</sup> Limit is average probability for hadron containing  $B$  quark to produce a positive lepton.

## ***CP VIOLATION PARAMETERS in semileptonic $b$ -hadron decays.***

### **$Re(\epsilon_b) / (1 + |\epsilon_b|^2)$**

CP impurity in semileptonic  $b$ -hadron decays.

<sup>1</sup> ABAZOV 14 reports a measurement of like-sign dimuon charge asymmetry of  $A_{SL}^b = (-4.96 \pm 1.53 \pm 0.72) \times 10^{-3}$  in semileptonic  $b$ -hadron decays.

<sup>2</sup> ABAZOV 11U reports a measurement of like-sign dimuon charge asymmetry of  $A_{SL}^b = (-7.87 \pm 1.72 \pm 0.93) \times 10^{-3}$  in semileptonic  $b$ -hadron decays.

<sup>3</sup> ABAZOV 10H reports a measurement of like-sign dimuon charge asymmetry of  $A_{SL}^b = (-9.57 \pm 2.51 \pm 1.46) \times 10^{-3}$  in semileptonic  $b$ -hadron decays. Using the measured production ratio of  $B_d^0$  and  $B_s^0$ , and the asymmetry of  $B_d^0 A_{SL}^d = (-4.7 \pm 4.6) \times 10^{-3}$  measured from  $B$ -factories, they obtain the asymmetry for  $B_s^0$  as  $A_{SL}^s = (-14.6 \pm 7.5) \times 10^{-3}$ .

## ***B-HADRON PRODUCTION FRACTIONS IN HADRONIC $Z$ DECAY***

The production fractions of  $b$ -hadrons in hadronic  $Z$  decays have been calculated using the best values of mean lives, mixing parameters and branching fractions in this edition by the Heavy Flavor Averaging Group (HFAG) (see <http://www.slac.stanford.edu/xorg/hfag/>).

The values reported below assume:

$$f(\bar{b} \rightarrow B^+) = f(\bar{b} \rightarrow B^0)$$

$$f(\bar{b} \rightarrow B^+) + f(\bar{b} \rightarrow B^0) + f(\bar{b} \rightarrow B_s^0) + f(b \rightarrow b\text{-baryon}) = 1$$

The values are:

$$f(\bar{b} \rightarrow B^+) = f(\bar{b} \rightarrow B^0) = 0.407 \pm 0.007$$

$$f(\bar{b} \rightarrow B_s^0) = 0.100 \pm 0.008$$

$$f(b \rightarrow b\text{-baryon}) = 0.085 \pm 0.011$$

$$f(\bar{b} \rightarrow B_s^0) / f(\bar{b} \rightarrow B_d^0) = 0.246 \pm 0.023$$

and their correlation coefficients are:

$$\text{cor}(B_s^0, b\text{-baryon}) = +0.073$$

$$\text{cor}(B_s^0, B^+ = B^0) = -0.633$$

$$\text{cor}(b\text{-baryon}, B^+ = B^0) = -0.818$$

as obtained using a time-integrated mixing parameter  $\overline{\chi} = 0.1259 \pm 0.0042$  given by a fit to heavy quark quantities with asymmetries removed (see the note "The Z boson").

## B-HADRON PRODUCTION FRACTIONS IN $p\bar{p}$ COLLISIONS AT Tevatron

The production fractions for  $b$ -hadrons in  $p\bar{p}$  collisions at the Tevatron have been calculated from the best values of mean lifetimes, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFAG) (see <http://www.slac.stanford.edu/xorg/hfag/>).

The values reported below assume:

$$f(\bar{b} \rightarrow B^+) = f(\bar{b} \rightarrow B^0)$$

$$f(\bar{b} \rightarrow B^+) + f(\bar{b} \rightarrow B^0) + f(\bar{b} \rightarrow B_s^0) + f(b \rightarrow b\text{-baryon}) = 1$$

The values are:

$$f(\bar{b} \rightarrow B^+) = f(\bar{b} \rightarrow B^0) = 0.344 \pm 0.021$$

$$f(\bar{b} \rightarrow B_s^0) = 0.115 \pm 0.013$$

$$f(b \rightarrow b\text{-baryon}) = 0.197 \pm 0.046$$

$$f(\bar{b} \rightarrow B_s^0) / f(\bar{b} \rightarrow B_d^0) = 0.334 \pm 0.041$$

and their correlation coefficients are:

$$\text{cor}(B_s^0, b\text{-baryon}) = -0.419$$

$$\text{cor}(B_s^0, B^+ = B^0) = +0.139$$

$$\text{cor}(b\text{-baryon}, B^+ = B^0) = -0.958$$

as obtained with the Tevatron average of time-integrated mixing parameter  $\overline{\chi} = 0.147 \pm 0.011$ .

## PRODUCTION ASYMMETRIES

### $A_C^{b\bar{b}}$

$A_C^{b\bar{b}} = [N(\Delta y > 0) - N(\Delta y < 0)] / [N(\Delta y > 0) + N(\Delta y < 0)]$  with  $\Delta y = |y_b| - |\bar{y}_b|$   
where  $y_{b/\bar{b}}$  is rapidity of  $b$  or  $\bar{b}$  quarks.
