

$$I(J^P) = \frac{1}{2}(0^-)$$

Quantum numbers not measured. Values shown are quark-model predictions.

See also the  $B^\pm/B^0$  ADMIXTURE and  $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE sections.

See the Note “Production and Decay of  $b$ -flavored Hadrons” at the beginning of the  $B^\pm$  Particle Listings and the Note on “ $B^0$ - $\bar{B}^0$  Mixing” near the end of the  $B^0$  Particle Listings.

## $B^0$ MASS

The fit uses  $m_{B^+}$ , ( $m_{B^0} - m_{B^+}$ ), and  $m_{B^0}$  to determine  $m_{B^+}$ ,  $m_{B^0}$ , and the mass difference.

<sup>1</sup> Measured using  $B \rightarrow J/\psi K^{(*)}$  decays.

<sup>2</sup> Measured mean life using fully reconstructed decays ( $J/\psi K^{(*)}$ ).

<sup>3</sup> Data analyzed using  $D/D^* \mu X$  vertices.

<sup>4</sup> Measurement performed using a combined fit of  $CP$ -violation, mixing and lifetimes.

<sup>5</sup> Measurement performed using an inclusive reconstruction and  $B$  flavor identification technique.

<sup>6</sup> Measured using fully reconstructed decays.

<sup>7</sup> Events are selected in which one  $B$  meson is fully reconstructed while the second  $B$  meson is reconstructed inclusively.

<sup>8</sup> Data analyzed using charge of secondary vertex.

<sup>9</sup> ABREU 95Q assumes  $B(B^0 \rightarrow D^{*-} \ell^+ \nu_\ell) = 3.2 \pm 1.7\%$ .

<sup>10</sup> Data analyzed using vertex-charge technique to tag  $B$  charge.

<sup>11</sup> AKERS 95T assumes  $B(B^0 \rightarrow D_s^{(*)} D^0) = 5.0 \pm 0.9\%$  to find  $B^+/B^0$  yield.

<sup>12</sup> Combined result of  $D/D^* \ell X$  analysis and fully reconstructed  $B$  analysis.

### $\tau_{B^+}/\tau_{B^0}$ (inferred from branching fractions)

These measurements are inferred from the branching fractions for semileptonic decay or other spectator-dominated decays by assuming that the rates for such decays are equal for  $B^0$  and  $B^+$ . We do not use measurements which assume equal production of  $B^0$  and  $B^+$  because of the large uncertainty in the production ratio.

“OUR EVALUATION” has been obtained by the Heavy Flavor Averaging Group (HFLAV) by taking into account correlations between measurements.

<sup>1</sup> ARTUSO 97 uses partial reconstruction of  $B \rightarrow D^* \ell \nu_\ell$  and independent of  $B^0$  and  $B^+$  production fraction.

<sup>2</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>3</sup> ATHANAS 94 uses events tagged by fully reconstructed  $B^-$  decays and partially or fully reconstructed  $B^0$  decays.

<sup>4</sup> Assumes equal production of  $B^0$  and  $B^+$ .

<sup>5</sup> ALBRECHT 92G data analyzed using  $B \rightarrow D_s \bar{D}, D_s \bar{D}^*, D_s^* \bar{D}, D_s^* \bar{D}^*$  events.

<sup>6</sup> BEAN 87B assume the fraction of  $B^0 \bar{B}^0$  events at the  $\Upsilon(4S)$  is 0.41.

### $\Delta\Gamma_{B_d^0} / \Gamma_{B_d^0}$

$\Gamma_{B_d^0}$  and  $\Delta\Gamma_{B_d^0}$  are the decay rate average and difference between two  $B_d^0$  CP eigenstates (light – heavy). The  $\lambda_{CP}$  characterizes  $B^0$  and  $\bar{B}^0$  decays to states of charmonium plus  $K_L^0$ , see the review on “CP Violation” in the reviews section.

“OUR EVALUATION” has been obtained by the Heavy Flavor Averaging Group (HFLAV) by taking into account correlations between measurements.

- <sup>1</sup> Measured using  $B^0 \rightarrow J/\psi K^{*0}(892)^0$  and  $B^0 \rightarrow J/\psi K_S^0$  decays, and assuming  $\beta = 21.9 \pm 0.7$  degrees.  
<sup>2</sup> Measured from the ratio of decay time distributions of  $B^0 \rightarrow J/\psi K_S^0$  and  $B^0 \rightarrow J/\psi K^{*0}$  decays.  
<sup>3</sup> Measured using the effective lifetimes of  $B^0 \rightarrow J/\psi K_S^0$  and  $B^0 \rightarrow J/\psi K^{*0}$  decays.  
<sup>4</sup> Reports  $-\Delta\Gamma_d/\Gamma_d$  using  $B^0 \rightarrow J/\psi K_S^0$ ,  $J/\psi K_L^0$ ,  $D^- \pi^+$ ,  $D^{*-} \pi^+$ ,  $D^{*-} \rho^+$ , and  $D^{*-} \ell^+ \nu$  decays.  
<sup>5</sup> Corresponds to 90% confidence range [-0.084, 0.068].  
<sup>6</sup> Used the measured  $\tau_{B^0} = 1.55 \pm 0.03$  ps. Corresponds to an upper limit of < 0.18 at 95% C.L.  
<sup>7</sup> BEHRENS 00B uses high-momentum lepton tags and partially reconstructed  $\bar{B}^0 \rightarrow D^{*+} \pi^-$ ,  $\rho^-$  decays to determine the flavor of the  $B$  meson. Assumes  $\Delta_{md}=0.478 \pm 0.018$  ps<sup>-1</sup> and  $\tau_{B^0}=1.548 \pm 0.032$  ps.

## $B^0$ DECAY MODES

$\bar{B}^0$  modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing. Modes which do not identify the charge state of the  $B$  are listed in the  $B^\pm/B^0$  ADMIXTURE section.

The branching fractions listed below assume 50%  $B^0\bar{B}^0$  and 50%  $B^+B^-$  production at the  $\Upsilon(4S)$ . We have attempted to bring older measurements up to date by rescaling their assumed  $\Upsilon(4S)$  production ratio to 50:50 and their assumed  $D$ ,  $D_S$ ,  $D^*$ , and  $\psi$  branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, e.g.,  $B \rightarrow D^\pm X$ , the values usually are multiplicities, not branching fractions. They can be greater than one.

- [a] An  $\ell$  indicates an  $e$  or a  $\mu$  mode, not a sum over these modes.
- [b]  $\bar{D}^{**}$  represents an excited state with mass  $2.2 < M < 2.8 \text{ GeV}/c^2$ .
- [c]  $\chi_{c1}(3872)^+$  is a hypothetical charged partner of the  $\chi_{c1}(3872)$ .
- [d] Stands for the possible candidates of  $K^*(1410)$ ,  $K_0^*(1430)$  and  $K_2^*(1430)$ .
- [e]  $B^0$  and  $B_s^0$  contributions not separated. Limit is on weighted average of the two decay rates.
- [f] This decay refers to the coherent sum of resonant and nonresonant  $J^P = 0^+ K\pi$  components with  $1.60 < m_{K\pi} < 2.15 \text{ GeV}/c^2$ .
- [g]  $X(214)$  is a hypothetical particle of mass  $214 \text{ MeV}/c^2$  reported by the HyperCP experiment, Physical Review Letters **94** 021801 (2005)
- [h] The value is for the sum of the charge states or particle/antiparticle states indicated.
- [i]  $\Theta(1540)^+$  denotes a possible narrow pentaquark state.
- [j] Here  $S$  and  $P$  are the hypothetical scalar and pseudoscalar particles with masses of  $2.5 \text{ GeV}/c^2$  and  $214.3 \text{ MeV}/c^2$ , respectively.

---

### CONSTRAINED FIT INFORMATION

An overall fit to 34 branching ratios uses 89 measurements and one constraint to determine 22 parameters. The overall fit has a  $\chi^2 = 63.6$  for 68 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

10.32±0.36±0.35	<sup>4</sup> OKABE	05	BELL	Repl. by URQUIJO 07
10.9 ±0.7 ±1.1	ATHANAS	94	CLE2	Sup. by ARTUSO 97

<sup>1</sup> URQUIJO 07 report a measurement of  $(9.80 \pm 0.29 \pm 0.21)\%$  for the partial branching fraction of  $B \rightarrow e\nu_e X_C$  decay with electron energy above 0.6 GeV. We converted the result to  $B \rightarrow e\nu_e X$  branching fraction.

<sup>2</sup> The measurements are obtained for charged and neutral  $B$  mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the  $B$  rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV:  $B(B^+ \rightarrow e^+\nu_e X) / B(B^0 \rightarrow e^+\nu_e X) = 1.074 \pm 0.041 \pm 0.026$ .

<sup>3</sup> ARTUSO 97 uses partial reconstruction of  $B \rightarrow D^* \ell \nu_\ell$  and inclusive semileptonic branching ratio from BARISH 96B  $(0.1049 \pm 0.0017 \pm 0.0043)$ .

<sup>4</sup> The measurements are obtained for charged and neutral  $B$  mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the  $B$  rest frame, and their ratio of  $B(B^+ \rightarrow e^+\nu_e X)/B(B^0 \rightarrow e^+\nu_e X) = 1.08 \pm 0.05 \pm 0.02$ .

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

$7.0 \pm 1.2 \pm 1.9$	47	<sup>23</sup> ALBRECHT	87J	ARG	$e^+ e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> Uses fully reconstructed  $D^{*-} \ell^+ \nu$  events ( $\ell = e$  or  $\mu$ ).

<sup>2</sup> Uses a fully reconstructed  $B$  meson as a tag on the recoil side.

<sup>3</sup> Measured using fully reconstructed  $D^*$  sample and a simultaneous fit to the Caprini-Lellouch-Neubert form factor parameters:  $\rho^2 = 1.191 \pm 0.048 \pm 0.028$ ,  $R_1(1) = 1.429 \pm 0.061 \pm 0.044$ , and  $R_2(1) = 0.827 \pm 0.038 \pm 0.022$ .

<sup>4</sup> Measured using fully reconstructed  $D^*$  sample.

<sup>5</sup> Uses the combined fit of both  $B^0 \rightarrow D^*(2010)^- \ell \nu$  and  $B^+ \rightarrow \bar{D}^*(2007)^0 \ell \nu$  samples.

<sup>6</sup> ABREU 01H measured using about 5000 partial reconstructed  $D^*$  sample.

<sup>7</sup> ABBIENDI 00Q assumes the fraction  $B(b \rightarrow B^0) = (39.7^{+1.8}_{-2.2})\%$ . This result is an average of two methods using exclusive and partial  $D^*$  reconstruction.

<sup>8</sup> BUSKULIC 97 assumes fraction  $(B^+) = \text{fraction}(B^0) = (37.8 \pm 2.2)\%$  and PDG 96 values for  $B$  lifetime and  $D^*$  and  $D$  branching fractions.

<sup>9</sup> Combines with previous partial reconstructed  $D^*$  measurement.

<sup>10</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>11</sup> The results are based on the same analysis and data sample reported in ADAM 03.

<sup>12</sup> ACKERSTAFF 97G assumes fraction  $(B^+) = \text{fraction}(B^0) = (37.8 \pm 2.2)\%$  and PDG 96 values for  $B$  lifetime and branching ratio of  $D^*$  and  $D$  decays.

<sup>13</sup> ABREU 96P result is the average of two methods using exclusive and partial  $D^*$  reconstruction.

<sup>14</sup> BARISH 95 use  $B(D^0 \rightarrow K^- \pi^+) = (3.91 \pm 0.08 \pm 0.17)\%$  and  $B(D^{*+} \rightarrow D^0 \pi^+) = (68.1 \pm 1.0 \pm 1.3)\%$ .

<sup>15</sup> BUSKULIC 95N assumes fraction  $(B^+) = \text{fraction}(B^0) = 38.2 \pm 1.3 \pm 2.2\%$  and  $\tau_{B^0} = 1.58 \pm 0.06$  ps.  $\Gamma(D^{*-} \ell^+ \nu_\ell)/\text{total} = [5.18 - 0.13(\text{fraction}(B^0) - 38.2) - 1.5(\tau_{B^0} - 1.58)]\%$ .

<sup>16</sup> ALBRECHT 94 assumes  $B(D^{*+} \rightarrow D^0 \pi^+) = 68.1 \pm 1.0 \pm 1.3\%$ . Uses partial reconstruction of  $D^{*+}$  and is independent of  $D^0$  branching ratios.

- 17 ALBRECHT 93 reports  $0.052 \pm 0.005 \pm 0.006$ . We rescale using the method described in STONE 94 but with the updated PDG 94  $B(D^0 \rightarrow K^- \pi^+)$ . We have taken their average  $e$  and  $\mu$  value. They also obtain  $\alpha = 2*\Gamma^0/(\Gamma^- + \Gamma^+) - 1 = 1.1 \pm 0.4 \pm 0.2$ ,  $A_{AF} = 3/4*(\Gamma^- - \Gamma^+)/\Gamma = 0.2 \pm 0.08 \pm 0.06$  and a value of  $|V_{cb}| = 0.036-0.045$  depending on model assumptions.
- 18 Combining  $\bar{D}^{*0} \ell^+ \nu_\ell$  and  $\bar{D}^{*-} \ell^+ \nu_\ell$  SANGHERA 93 test  $V-A$  structure and fit the decay angular distributions to obtain  $A_{FB} = 3/4*(\Gamma^- - \Gamma^+)/\Gamma = 0.14 \pm 0.06 \pm 0.03$ . Assuming a value of  $V_{cb}$ , they measure  $V$ ,  $A_1$ , and  $A_2$ , the three form factors for the  $D^* \ell \nu_\ell$  decay, where results are slightly dependent on model assumptions.
- 19 ANTREASYAN 90B is average over  $B$  and  $\bar{D}^*$  (2010) charge states.
- 20 The measurement of ALBRECHT 89C suggests a  $D^*$  polarization  $\gamma_L/\gamma_T$  of  $0.85 \pm 0.45$ . or  $\alpha = 0.7 \pm 0.9$ .
- 21 ALBRECHT 89J is ALBRECHT 87J value rescaled using  $B(D^*(2010)^- \rightarrow D^0 \pi^-) = 0.57 \pm 0.04 \pm 0.04$ . Superseded by ALBRECHT 93.
- 22 We have taken average of the the BORTOLETTO 89B values for electrons and muons,  $0.046 \pm 0.005 \pm 0.007$ . We rescale using the method described in STONE 94 but with the updated PDG 94  $B(D^0 \rightarrow K^- \pi^+)$ . The measurement suggests a  $D^*$  polarization parameter value  $\alpha = 0.65 \pm 0.66 \pm 0.25$ .
- 23 ALBRECHT 87J assume  $\mu-e$  universality, the  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = 0.45$ , the  $B(D^0 \rightarrow K^- \pi^+) = (0.042 \pm 0.004 \pm 0.004)$ , and the  $B(D^*(2010)^- \rightarrow D^0 \pi^-) = 0.49 \pm 0.08$ . Superseded by ALBRECHT 89J.

WEIGHTED AVERAGE  
 $2.45 \pm 0.32$  (Error scaled by 1.6)

- <sup>1</sup> The signal events are tagged by a second  $B$  meson reconstructed in the fully hadronic decays.
- <sup>2</sup>  $B^+$  and  $B^0$  decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.
- <sup>3</sup> The  $B^0$  and  $B^+$  results are combined assuming the isospin,  $B$  lifetimes, and relative charged/neutral  $B$  production at the  $\Upsilon(4S)$ .
- <sup>4</sup> The signal events are tagged by a second  $B$  meson reconstructed in the semileptonic mode  $B \rightarrow D^{(*)} \ell \nu_\ell$ .
- <sup>5</sup> Averaging with ALEXANDER 96T results including experimental and theoretical correlations considered, BEHRENS 00 reports systematic errors  $^{+0.33}_{-0.46} \pm 0.41$ , where the second error is theoretical model dependence. We combine these in quadrature.

- <sup>6</sup> ATHAR 03 reports systematic errors  $^{+0.47}_{-0.50} \pm 0.41 \pm 0.01$ , which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.
- <sup>7</sup> Uses isospin constraints and extrapolation to all electron energies according to five different form-factor calculations. The second error combines the systematic and theoretical uncertainties in quadrature.
- <sup>8</sup> BEHRENS 00 reports  $^{+0.35}_{-0.40} \pm 0.50$ , where the second error is the theoretical model dependence. We combine these in quadrature.  $B^+$  and  $B^0$  decays combined using isospin symmetry:  $\Gamma(B^0 \rightarrow \rho^- \ell^+ \nu) = 2\Gamma(B^+ \rightarrow \rho^0 \ell^+ \nu) \approx 2\Gamma(B^+ \rightarrow \omega \ell^+ \nu)$ . No evidence for  $\omega \ell \nu$  is reported.
- <sup>9</sup> ALEXANDER 96T reports  $^{+0.5}_{-0.7} \pm 0.5$  where the second error is the theoretical model dependence. We combine these in quadrature.  $B^+$  and  $B^0$  decays combined using isospin symmetry:  $\Gamma(B^0 \rightarrow \rho^- \ell^+ \nu) = 2\Gamma(B^+ \rightarrow \rho^0 \ell^+ \nu) \approx 2\Gamma(B^+ \rightarrow \omega \ell^+ \nu)$ . No evidence for  $\omega \ell \nu$  is reported.
- <sup>10</sup> BEAN 93B limit set using ISGW Model. Using isospin and the quark model to combine  $\Gamma(\rho^0 \ell^+ \nu_\ell)$  and  $\Gamma(\omega \ell^+ \nu_\ell)$  with this result, they obtain a limit  $<(1.6-2.7) \times 10^{-4}$  at 90% CL for  $B^+ \rightarrow (\omega \text{ or } \rho^0) \ell^+ \nu_\ell$ . The range corresponds to the ISGW, WSB, and KS models. An upper limit on  $|V_{ub}/V_{cb}| < 0.08-0.13$  at 90% CL is derived as well.

$\Gamma(\pi^- \ell^+ \nu_\ell) / \Gamma_{\text{total}}$   $\Gamma_{19} / \Gamma$   
 "OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV) and the procedure is described at <https://hflav.web.cern.ch/>.

- <sup>1</sup> The signal events are tagged by a second  $B$  meson reconstructed in the fully hadronic decays.
- <sup>2</sup> Uses loose neutrino reconstruction technique. Assumes  $B(\Upsilon(4S) \rightarrow B^+ B^-) = (51.6 \pm 0.6)\%$  and  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = (48.4 \pm 0.6)\%$ .
- <sup>3</sup> Reports also a branching fraction value  $B(B^0 \rightarrow \pi^- \ell^+ \nu) = (1.45 \pm 0.04 \pm 0.06) \times 10^{-4}$  from the decays of  $B^+$  and  $B^0$  that are combined using the isospin symmetry relation.
- <sup>4</sup> Using the isospin symmetry relation,  $B^+$  and  $B^0$  branching fractions are combined.
- <sup>5</sup> The  $B^0$  and  $B^+$  results are combined assuming the isospin,  $B$  lifetimes, and relative charged/neutral  $B$  production at the  $\Upsilon(4S)$ .

<sup>6</sup> Also report the rate for  $q^2 > 16 \text{ GeV}^2$  of  $(0.41 \pm 0.08 \pm 0.04) \times 10^{-4}$  from which they obtain  $|V_{ub}| = 3.6 \pm 0.4 \pm 0.2_{-0.4}^{+0.6}$  (last error is from theory).

<sup>7</sup> The signal events are tagged by a second  $B$  meson reconstructed in the semileptonic mode  $B \rightarrow D^{(*)} \ell \nu \ell$ .

<sup>8</sup> The analysis uses events in which the signal  $B$  decays are reconstructed with an innovative loose neutrino reconstruction technique.

<sup>9</sup> The signals are tagged by a second  $B$  meson reconstructed in a semileptonic or hadronic decay. The  $B^0$  and  $B^+$  results are combined assuming the isospin symmetry.

<sup>10</sup>  $B^+$  and  $B^0$  decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.

<sup>11</sup> ATHAR 03 reports systematic errors  $0.11 \pm 0.01 \pm 0.07$ , which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.

<sup>12</sup> ALEXANDER 96T gives systematic errors  $\pm 0.3 \pm 0.2$  where the second error reflects the estimated model dependence. We combine these in quadrature. Assumes isospin symmetry:  $\Gamma(B^0 \rightarrow \pi^- \ell^+ \nu) = 2 \times \Gamma(B^+ \rightarrow \pi^0 \ell^+ \nu)$ .

$2.73 \pm 0.19 \pm 0.05$  <sup>1,7</sup> AUBERT, B 04O BABR Repl. by AUBERT 07H

$2.83 \pm 0.42 \pm 0.05$  <sup>81</sup> <sup>8</sup> ALAM 94 CLE2 Repl. by AHMED 02B

$3.1 \pm 1.3 \pm 1.0$  <sup>7</sup> <sup>5</sup> ALBRECHT 88K ARG  $e^+e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>2</sup> Uses a missing-mass method. Does not depend on  $D$  branching fractions or  $B^+/B^0$  production rates.

<sup>3</sup> AHMED 02B reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of  $B^0$  and  $B^+$ , which is not included here.

<sup>4</sup> BORTOLETTO 92 assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ .

<sup>5</sup> ALBRECHT 88K assumes  $B^0\bar{B}^0:B^+B^-$  production ratio is 45:55. Superseded by ALBRECHT 90J which assumes 50:50.

<sup>6</sup> BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.

<sup>7</sup> AUBERT, B 04O reports  $[\Gamma(B^0 \rightarrow D^- \pi^+)/\Gamma_{\text{total}}] \times [B(D^+ \rightarrow K_S^0 \pi^+)] = (42.7 \pm 2.1 \pm 2.2) \times 10^{-6}$  which we divide by our best value  $B(D^+ \rightarrow K_S^0 \pi^+) = (1.562 \pm 0.031) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>8</sup> ALAM 94 reports  $[\Gamma(B^0 \rightarrow D^- \pi^+)/\Gamma_{\text{total}}] \times [B(D^+ \rightarrow K^- 2\pi^+)] = (0.265 \pm 0.032 \pm 0.023) \times 10^{-3}$  which we divide by our best value  $B(D^+ \rightarrow K^- 2\pi^+) = (9.38 \pm 0.16) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

• • • We do not use the following data for averages, fits, limits, etc. • • •				
8.0 ± 0.6 ± 1.5		<sup>2,3</sup> SATPATHY	03	BELL Repl. by KUZMIN 07
< 16	90	<sup>2</sup> ALAM	94	CLE2 $e^+ e^- \rightarrow \Upsilon(4S)$
< 70	90	<sup>4</sup> BORTOLETTO	92	CLEO $e^+ e^- \rightarrow \Upsilon(4S)$
< 340	90	<sup>5</sup> BEBEK	87	CLEO $e^+ e^- \rightarrow \Upsilon(4S)$
700 ± 500	5	<sup>6</sup> BEHREND	83	CLEO $e^+ e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> The second uncertainty combines in quadrature all systematic uncertainties quoted in the paper. AAIJ 15Y reports  $B(B^0 \rightarrow \bar{D}^0 \pi^+ \pi^-) = (8.46 \pm 0.14 \pm 0.49) \times 10^{-4}$  in the kinematic region  $m(\bar{D}^0 \pi^\pm) > 2.1$  GeV which we corrected to the full phase-space dividing by 0.945 from Belle.

<sup>2</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>3</sup> No assumption about the intermediate mechanism is made in the analysis.

<sup>4</sup> BORTOLETTO 92 assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ . The product branching fraction into  $D_0^*(2340)\pi$  followed by  $D_0^*(2340) \rightarrow D^0 \pi$  is  $< 0.0001$  at 90% CL and into  $D_2^*(2460)$  followed by  $D_2^*(2460) \rightarrow D^0 \pi$  is  $< 0.0004$  at 90% CL.

<sup>5</sup> BEBEK 87 assume the  $\Upsilon(4S)$  decays 43% to  $B^0\bar{B}^0$ . We rescale to 50%.  $B(D^0 \rightarrow K^- \pi^+) = (4.2 \pm 0.4 \pm 0.4)\%$  and  $B(D^0 \rightarrow K^- \pi^+ \pi^+ \pi^-) = (9.1 \pm 0.8 \pm 0.8)\%$  were used.

<sup>6</sup> Corrected by us using assumptions:  $B(D^0 \rightarrow K^- \pi^+) = (0.042 \pm 0.006)$  and  $B(\Upsilon(4S) \rightarrow B^0\bar{B}^0) = 50\%$ . The product branching ratio is  $B(B^0 \rightarrow \bar{D}^0 \pi^+ \pi^-)B(\bar{D}^0 \rightarrow K^+ \pi^-) = (0.39 \pm 0.26) \times 10^{-2}$ .

$\Gamma(D^*(2010)^- \pi^+)/\Gamma_{\text{total}}$   $\Gamma_{44}/\Gamma$

<sup>1</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>2</sup> AUBERT,BE 06J reports  $[\Gamma(B^0 \rightarrow D^*(2010)^- \pi^+)/\Gamma_{\text{total}}] / [B(B^0 \rightarrow D^- \pi^+)] = 0.99 \pm 0.11 \pm 0.08$  which we multiply by our best value  $B(B^0 \rightarrow D^- \pi^+) = (2.52 \pm 0.13) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>3</sup> Uses a missing-mass method. Does not depend on  $D$  branching fractions or  $B^+ / B^0$  production rates.

<sup>4</sup> BRANDENBURG 98 assume equal production of  $B^+$  and  $B^0$  at  $\Upsilon(4S)$  and use the  $D^*$  reconstruction technique. The first error is their experiment's error and the second error is the systematic error from the PDG 96 value of  $B(D^* \rightarrow D\pi)$ .

<sup>5</sup> ALAM 94 assume equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and use the CLEO II  $B(D^*(2010)^+ \rightarrow D^0 \pi^+)$  and absolute  $B(D^0 \rightarrow K^- \pi^+)$  and the PDG 1992  $B(D^0 \rightarrow K^- \pi^+ \pi^0) / B(D^0 \rightarrow K^- \pi^+)$  and  $B(D^0 \rightarrow K^- 2\pi^+ \pi^-) / B(D^0 \rightarrow K^- \pi^+)$ .

<sup>6</sup> BORTOLETTO 92 reports  $(4.0 \pm 1.0 \pm 0.7) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow D^*(2010)^- \pi^+)/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$  assuming  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$ , which we rescale to our best value  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ .

<sup>7</sup> ALBRECHT 90J reports  $(2.8 \pm 0.9 \pm 0.6) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow D^*(2010)^- \pi^+)/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$  assuming  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$ , which we rescale to our best value  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ .

<sup>8</sup> BEBEK 87 reports  $(2.8^{+1.5+1.0}_{-1.2-0.6}) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow D^*(2010)^- \pi^+) / \Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$  assuming  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$ , which we rescale to our best value  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92 and ALBRECHT 90J.

<sup>9</sup> Assumes  $B(Z \rightarrow b\bar{b}) = 0.217$  and 38%  $B_d$  production fraction.

<sup>10</sup> ALBRECHT 87C use PDG 86 branching ratios for  $D$  and  $D^*(2010)$  and assume  $B(\Upsilon(4S) \rightarrow B^+ B^-) = 55\%$  and  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = 45\%$ . Superseded by ALBRECHT 90J.

<sup>11</sup> ALBRECHT 86F uses pseudomass that is independent of  $D^0$  and  $D^+$  branching ratios.

<sup>12</sup> Assumes  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.60^{+0.08}_{-0.15}$ . Assumes  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = 0.40 \pm 0.02$  Does not depend on  $D$  branching ratios.

---	----	----------------------	------	------------------------------------

<sup>1</sup> The second error combines the systematic and theoretical uncertainties in quadrature. CSORNA 03 includes data used in ALAM 94. A full angular fit to three complex helicity amplitudes is performed.

<sup>2</sup> Assumes equal production of  $B^0$  and  $B^+$  at the  $\Upsilon(4S)$  resonance.

<sup>3</sup> BORTOLETTO 92 reports  $0.019 \pm 0.008 \pm 0.011$  from a measurement of  $[\Gamma(B^0 \rightarrow D^*(2010)^- \rho^+)/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$  assuming  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$ , which we rescale to our best value  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ .

<sup>4</sup> ALBRECHT 90J reports  $0.007 \pm 0.003 \pm 0.003$  from a measurement of  $[\Gamma(B^0 \rightarrow D^*(2010)^- \rho^+)/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$  assuming  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$ , which we rescale to our best value  $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and uses Mark III branching fractions for the  $D$ .

<sup>5</sup> MATVIENKO 15 reports  $B(B^0 \rightarrow D^*(2010)^- \rho^+, \rho^+ \rightarrow \omega \pi^+) = (1.48 \pm 0.27^{+0.15+0.21}_{-0.09-0.56}) \times 10^{-3}$ . The last uncertainty is a model one.

<sup>6</sup> ALAM 94 assume equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$  and use the CLEO II  $B(D^*(2010)^+ \rightarrow D^0 \pi^+)$  and absolute  $B(D^0 \rightarrow K^- \pi^+)$  and the PDG 1992  $B(D^0 \rightarrow K^- \pi^+ \pi^0)/B(D^0 \rightarrow K^- \pi^+)$  and  $B(D^0 \rightarrow K^- 2\pi^+ \pi^-)/B(D^0 \rightarrow K^- \pi^+)$ .

<sup>7</sup> This decay is nearly completely longitudinally polarized,  $\Gamma_L/\Gamma = (93 \pm 5 \pm 5)\%$ , as expected from the factorization hypothesis (ROSNER 90). The nonresonant  $\pi^+ \pi^0$  contribution under the  $\rho^+$  is less than 9% at 90% CL.

<sup>8</sup> Uses  $B(D^* \rightarrow D^0 \pi^+) = 0.6 \pm 0.15$  and  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = 0.4$ . Does not depend on  $D$  branching ratios.

**$\Gamma(D^*(2010)^- K^+)/\Gamma_{\text{total}}$   $\Gamma_{52}/\Gamma$**

-----	----	-------------------------	------	-------------------------

<22	90	<sup>5</sup> ASNER 97	CLE2	Repl. by ARTUSO 99
-----	----	-----------------------	------	--------------------

<sup>1</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>2</sup> AUBERT 02M also assumes the measured  $CP$ -odd fraction of the final states is  $0.22 \pm 0.18 \pm 0.03$ .

<sup>3</sup> ARTUSO 99 uses  $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = (48 \pm 4)\%$ .

<sup>4</sup> BARATE 98Q (ALEPH) observes 2 events with an expected background of  $0.10 \pm 0.03$  which corresponds to a branching ratio of  $(2.3 \begin{smallmatrix} +1.9 \\ -1.2 \end{smallmatrix} \pm 0.4) \times 10^{-3}$ .

<sup>5</sup> ASNER 97 at CLEO observes 1 event with an expected background of  $0.022 \pm 0.011$ . This corresponds to a branching ratio of  $(5.3 \begin{smallmatrix} +7.1 \\ -3.7 \end{smallmatrix} \pm 1.0) \times 10^{-4}$ .

<sup>1</sup> AUBERT 07AV reports  $[\Gamma(B^0 \rightarrow J/\psi(1S)K^*(892)^0)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow p\bar{p})] = (2.82^{+0.30+0.36}_{-0.28-0.35}) \times 10^{-6}$  which we divide by our best value  $B(J/\psi(1S) \rightarrow p\bar{p}) = (2.120 \pm 0.029) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>2</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>3</sup> ABE 98O reports  $[B(B^0 \rightarrow J/\psi(1S)K^*(892)^0)]/[B(B^+ \rightarrow J/\psi(1S)K^+)] = 1.76 \pm 0.14 \pm 0.15$ . We multiply by our best value  $B(B^+ \rightarrow J/\psi(1S)K^+) = (9.9 \pm 1.0) \times 10^{-4}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>5</sup> BORTOLETTO 92 reports  $(1.1 \pm 0.5 \pm 0.3) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow J/\psi(1S)K^*(892)^0)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+ e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+ e^-) = 0.069 \pm 0.009$ , which we rescale to our best value  $B(J/\psi(1S) \rightarrow e^+ e^-) = (5.971 \pm 0.032) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>6</sup> ALBRECHT 90J reports  $(1.1 \pm 0.5 \pm 0.2) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow J/\psi(1S)K^*(892)^0)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+ e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+ e^-) = 0.069 \pm 0.009$ , which we rescale to our best value  $B(J/\psi(1S) \rightarrow e^+ e^-) = (5.971 \pm 0.032) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>7</sup> BEBEK 87 reports  $(3.5 \pm 1.6 \pm 0.3) \times 10^{-3}$  from a measurement of  $[\Gamma(B^0 \rightarrow J/\psi(1S)K^*(892)^0)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+ e^-)]$  assuming  $B(J/\psi(1S) \rightarrow e^+ e^-) = 0.069 \pm 0.009$ , which we rescale to our best value  $B(J/\psi(1S) \rightarrow e^+ e^-) = (5.971 \pm 0.032) \times 10^{-2}$ . Our first error is their experiment's error and our second error

is the systematic error from using our best value. Updated in BORTOLETTO 92 to use the same assumptions.

<sup>8</sup> ABE 96H assumes that  $B(B^+ \rightarrow J/\psi K^+) = (1.02 \pm 0.14) \times 10^{-3}$ .

<sup>9</sup> The neutral and charged  $B$  events together are predominantly longitudinally polarized,  $\Gamma_L/\Gamma = 0.080 \pm 0.08 \pm 0.05$ . This can be compared with a prediction using HQET, 0.73 (KRAMER 92). This polarization indicates that the  $B \rightarrow \psi K^*$  decay is dominated by the  $CP = -1$   $CP$  eigenstate. Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>10</sup> ALBRECHT 94G measures the polarization in the vector-vector decay to be predominantly longitudinal,  $\Gamma_T/\Gamma = 0.03 \pm 0.16 \pm 0.15$  making the neutral decay a  $CP$  eigenstate when the  $K^{*0}$  decays through  $K_S^0 \pi^0$ .

<sup>11</sup> ALBAJAR 91E assumes  $B_d^0$  production fraction of 36%.

<sup>12</sup> ALBRECHT 87D assume  $B^+ B^- / B^0 \bar{B}^0$  ratio is 55/45. Superseded by ALBRECHT 90J.

<sup>13</sup> ALAM 86 assumes  $B^\pm / B^0$  ratio is 60/40. The observation of the decay  $B^+ \rightarrow J/\psi K^*(892)^+$  (HAAS 85) has been retracted in this paper.

<sup>1</sup>AAIJ 18F uses Dalitz plot analysis of the  $B^0 \rightarrow K_S^0 \pi^+ \pi^-$  final state decays. For the branching fraction of the reference mode, the PDG 18 average  $B(B^0 \rightarrow K_S^0 \pi^+ \pi^-) = (4.96 \pm 0.20) \times 10^{-5}$  is used. We compute  $B(B^0 \rightarrow \chi_{c0}K^0)$  using the PDG value  $B(\chi_{c0} \rightarrow \pi\pi) = (8.51 \pm 0.33) \times 10^{-3}$  and 2/3 for the  $\pi^+ \pi^-$  fraction. Our first error is their experiment's error and the second error is systematic error from using our best value.

<sup>2</sup>Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>3</sup>LEES 12I reports  $[\Gamma(B^0 \rightarrow \chi_{c0}K^0)/\Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow K_S^0 K_S^0)] = (0.46^{+0.25}_{-0.17} \pm 0.21) \times 10^{-6}$  which we divide by our best value  $B(\chi_{c0}(1P) \rightarrow K_S^0 K_S^0) = (3.16 \pm 0.17) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup>Measured in the  $B^0 \rightarrow K_S^0 K^+ K^-$  decay.

<sup>5</sup>Uses Dalitz plot analysis of the  $B^0 \rightarrow K^0 \pi^+ \pi^-$  final state decays.

<sup>6</sup>EDWARDS 01 assumes equal production of  $B^0$  and  $B^+$  at the  $\Upsilon(4S)$ . The correlated uncertainties (28.3)% from  $B(J/\psi(1S) \rightarrow \gamma \eta_c)$  in those modes have been accounted for.

< 700	90	<sup>3</sup> BATTLE	93 CLE2	$e^+ e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> Supercedes results of AAIJ 12AR.

<sup>2</sup> DUH 13 reports also for the same data  $B(B^0 \rightarrow K^+ K^-) < 0.20 \times 10^{-6}$  at 90% CL.

<sup>3</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>4</sup> AAIJ 12AR reports  $[\Gamma(B^0 \rightarrow K^+ K^-)/\Gamma_{\text{total}}] / [B(B_s^0 \rightarrow K^+ K^-)] / [\Gamma(\bar{b} \rightarrow B_s^0)/\Gamma(\bar{b} \rightarrow B^0)] = 0.018_{-0.007}^{+0.008} \pm 0.009$  which we multiply by our best values  $B(B_s^0 \rightarrow K^+ K^-) = (2.66 \pm 0.22) \times 10^{-5}$ ,  $\Gamma(\bar{b} \rightarrow B_s^0)/\Gamma(\bar{b} \rightarrow B^0) = 0.246 \pm 0.023$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.

<sup>5</sup> Reported a central value of  $(0.23 \pm 0.10 \pm 0.10) \times 10^{-6}$  using  $B(B^0 \rightarrow K^+ \pi^-) = (19.4 \pm 0.6) \times 10^{-6}$ .

<sup>6</sup> Obtains this result from  $B(K^+ K^-)/B(K^+ \pi^-) = 0.020 \pm 0.008 \pm 0.006$ , assuming  $B(B^0 \rightarrow K^+ \pi^-) = (19.4 \pm 0.6) \times 10^{-6}$ .

<sup>7</sup> ABULENCIA,A 06D obtains this from  $\Gamma(K^+ K^-)/\Gamma(K^+ \pi^-) < 0.10$  at 90% CL, assuming  $B(B^0 \rightarrow K^+ \pi^-) = (18.9 \pm 0.7) \times 10^{-6}$ .

<sup>8</sup> ABE 00C assumes  $B(Z \rightarrow b\bar{b}) = (21.7 \pm 0.1)\%$  and the  $B$  fractions  $f_{B^0} = f_{B^+} = (39.7_{-2.2}^{+1.8})\%$  and  $f_{B_s} = (10.5_{-2.2}^{+1.8})\%$ .

<sup>9</sup> ADAM 96D assumes  $f_{B^0} = f_{B^-} = 0.39$  and  $f_{B_s} = 0.12$ . Contributions from  $B^0$  and  $B_s$  decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral  $B$  mesons.

<sup>10</sup> BUSKULIC 96V assumes PDG 96 production fractions for  $B^0$ ,  $B^+$ ,  $B_s$ ,  $b$  baryons.

<sup>11</sup> Assumes a  $B^0$ ,  $B^-$  production fraction of 0.39 and a  $B_s$  production fraction of 0.12. Contributions from  $B^0$  and  $B_s^0$  decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral  $B$  mesons.

<21	90	<sup>6</sup> FU	97 CLE2	$e^+ e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> Assumes equal production of  $B^+$  and  $B^0$  at the  $\Upsilon(4S)$ .

<sup>2</sup> AUBERT 08BN reports  $(1.89 \pm 0.21 \pm 0.49) \times 10^{-5}$  from a measurement of  $[\Gamma(B^0 \rightarrow \bar{\Lambda}_c^- p) / \Gamma_{\text{total}}] \times [B(\Lambda_c^+ \rightarrow p K^- \pi^+)]$  assuming  $B(\Lambda_c^+ \rightarrow p K^- \pi^+) = (5.0 \pm 1.3) \times 10^{-2}$ , which we rescale to our best value  $B(\Lambda_c^+ \rightarrow p K^- \pi^+) = (6.28 \pm 0.32) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>3</sup> The second error for GABYSHEV 03 includes the systematic and the error of  $\Lambda_c \rightarrow \bar{p} K^+ \pi^-$  decay branching fraction.

<sup>4</sup> Uses the value for  $\Lambda_c \rightarrow p K^- \pi^+$  branching ratio  $(5.0 \pm 1.3)\%$ .

<sup>5</sup> DYTMAN 02 measurement uses  $B(\Lambda_c^- \rightarrow \bar{p}K^+\pi^-) = 5.0 \pm 1.3\%$ . The second error includes the systematic and the uncertainty of the branching ratio.

<sup>6</sup> FU 97 uses PDG 96 values of  $\Lambda_c$  branching ratio.

<sup>1</sup> Corresponds to a 95% CL upper limit of  $< 2.1 \times 10^{-10}$ .

<sup>2</sup> Uses normalization mode  $B(B^+ \rightarrow J/\psi K^+) = (1.010 \pm 0.029) \times 10^{-3}$  and  $B$  production ratio  $f(b \rightarrow B^0)/f(b \rightarrow B^+) = 0.256 \pm 0.013$ .

<sup>3</sup> Corresponds to a 95% CL upper limit of  $< 3.4 \times 10^{-10}$ .

<sup>4</sup> Uses normalization mode  $B(B^+ \rightarrow J/\psi K^+) = (1.01 \pm 0.03) \times 10^{-3}$ .

<sup>5</sup> This value is obtained from a profile-likelihood fit, see Fig. 9. It corresponds to an upper limit of  $< 0.42 \times 10^{-9}$  at 95% C.L.

<sup>6</sup> Derived from the combined fit to CMS and LHCb data. Uncertainty includes both statistical and systematic component. Also reports  $B(B^0 \rightarrow \mu^+ \mu^-)/B(B_s \rightarrow \mu^+ \mu^-) = 0.14^{+0.08}_{-0.06}$ .

<sup>7</sup> Uses  $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$  and  $B(B^0 \rightarrow K^+ \pi^-) = (1.94 \pm 0.06) \times 10^{-5}$  for normalization.

<sup>8</sup> Reports also a limit of  $< 7.4 \times 10^{-10}$  at 95% CL. Uses normalization modes  $B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+$  and  $B^0 \rightarrow K^+ \pi^-$ .

<sup>9</sup> Uses normalization mode  $B(B^+ \rightarrow J/\psi K^+) = (10.22 \pm 0.35) \times 10^{-4}$ .

<sup>10</sup> Reports also a limit of  $< 9.2 \times 10^{-10}$  at 90% CL. and uses  $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.0 \pm 0.2) \times 10^{-5}$  for normalization.

<sup>11</sup> Uses  $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$ .

<sup>12</sup> Uses  $B$  production ratio  $f(\bar{b} \rightarrow B^+)/f(\bar{b} \rightarrow B_s^0) = 3.71 \pm 0.47$  and three normalization modes.

## POLARIZATION IN $B^0$ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ( $L$ ) or both are transverse and parallel ( $\parallel$ ) or perpendicular ( $\perp$ ) to each other with the parameters  $\Gamma_L/\Gamma$ ,  $\Gamma_{\perp}/\Gamma$ , and the relative phases  $\phi_{\parallel}$  and  $\phi_{\perp}$ . See the definitions in the note on “Polarization in  $B$  Decays” review in the  $B^0$  Particle Listings.

 $B^0 - \bar{B}^0$  Mixing **$B^0 - \bar{B}^0$  MIXING PARAMETERS**

For a discussion of  $B^0 - \bar{B}^0$  mixing see the note on “ $B^0 - \bar{B}^0$  Mixing” in the  $B^0$  Particle Listings above.

$\chi_d$  is a measure of the time-integrated  $B^0 - \bar{B}^0$  mixing probability that a produced  $B^0$  ( $\bar{B}^0$ ) decays as a  $\bar{B}^0$  ( $B^0$ ). Mixing violates  $\Delta B \neq 2$  rule.

$$\chi_d = \frac{x_d^2}{2(1+x_d^2)}$$

$$x_d = \frac{\Delta m_{B^0}}{\Gamma_{B^0}} = (m_{B_H^0} - m_{B_L^0}) \tau_{B^0} ,$$

where  $H, L$  stand for heavy and light states of two  $B^0$   $CP$  eigenstates and  $\tau_{B^0} = \frac{1}{0.5(\Gamma_{B_H^0} + \Gamma_{B_L^0})}$ .

 **$\chi_d$** 

This  $B^0 - \bar{B}^0$  mixing parameter is the probability (integrated over time) that a produced  $B^0$  (or  $\bar{B}^0$ ) decays as a  $\bar{B}^0$  (or  $B^0$ ), e.g. for inclusive lepton decays

$$\begin{aligned} \chi_d &= \Gamma(B^0 \rightarrow \ell^- X \text{ (via } \bar{B}^0)) / \Gamma(B^0 \rightarrow \ell^\pm X) \\ &= \Gamma(\bar{B}^0 \rightarrow \ell^+ X \text{ (via } B^0)) / \Gamma(\bar{B}^0 \rightarrow \ell^\pm X) \end{aligned}$$

Where experiments have measured the parameter  $r = \chi / (1 - \chi)$ , we have converted to  $\chi$ . Mixing violates the  $\Delta B \neq 2$  rule.

Note that the measurement of  $\chi$  at energies higher than the  $\Upsilon(4S)$  have not separated  $\chi_d$  from  $\chi_s$  where the subscripts indicate  $B^0(\bar{b}d)$  or  $B_s^0(\bar{b}s)$ . They are listed in the  $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE section.

The experiments at  $\Upsilon(4S)$  make an assumption about the  $B^0 \bar{B}^0$  fraction and about the ratio of the  $B^\pm$  and  $B^0$  semileptonic branching ratios (usually that it equals one).

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements, includes  $\chi_d$  calculated from  $\Delta m_{B^0}$  and  $\tau_{B^0}$ .

<sup>1</sup> BEHRENS 00B uses high-momentum lepton tags and partially reconstructed  $\overline{B}^0 \rightarrow D^{*+}\pi^-, \rho^-$  decays to determine the flavor of the  $B$  meson.

<sup>2</sup> ALBRECHT 94 reports  $r=0.194 \pm 0.062 \pm 0.054$ . We convert to  $\chi$  for comparison. Uses tagged events (lepton + pion from  $D^*$ ).

<sup>3</sup> BARTELT 93 analysis performed using tagged events (lepton+pion from  $D^*$ ). Using dilepton events they obtain  $0.157 \pm 0.016^{+0.033}_{-0.028}$ .

<sup>4</sup> ALBRECHT 92L is a combined measurement employing several lepton-based techniques. It uses all previous ARGUS data in addition to new data and therefore supersedes ALBRECHT 87I. A value of  $r = 20.6 \pm 7.0\%$  is directly measured. The value can be used to measure  $x = \Delta M/\Gamma = 0.72 \pm 0.15$  for the  $B_d$  meson. Assumes  $f_{+-}/f_0 = 1.0 \pm 0.05$  and uses  $\tau_{B^\pm}/\tau_{B^0} = (0.95 \pm 0.14) (f_{+-}/f_0)$ .

<sup>5</sup> Uses  $D^{*+}K^\pm$  correlations.

<sup>6</sup> Uses  $(D^{*+}\ell^-)K^\pm$  correlations.

<sup>7</sup> These experiments see a combination of  $B_s$  and  $B_d$  mesons.

<sup>8</sup> ALBRECHT 87I is inclusive measurement with like-sign dileptons, with tagged  $B$  decays plus leptons, and one fully reconstructed event. Measures  $r=0.21 \pm 0.08$ . We convert to  $\chi$  for comparison. Superseded by ALBRECHT 92L.

<sup>9</sup> BEAN 87B measured  $r < 0.24$ ; we converted to  $\chi$ .

<sup>10</sup> Same-sign dilepton events. Limit assumes semileptonic BR for  $B^+$  and  $B^0$  equal. If  $B^0/B^\pm$  ratio  $< 0.58$ , no limit exists. The limit was corrected in BEAN 87B from  $r < 0.30$  to  $r < 0.37$ . We converted this limit to  $\chi$ .

$$\Delta m_{B^0} = m_{B_H^0} - m_{B_L^0}$$

$\Delta m_{B^0}$  is a measure of  $2\pi$  times the  $B^0-\overline{B}^0$  oscillation frequency in time-dependent mixing experiments.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and includes  $\Delta m_d$  calculated from  $\chi_d$  measured at  $\Upsilon(4S)$ .

- 1 Uses semileptonic decays of  $B^0 \rightarrow D^- \mu^+ \nu_\mu X$  and  $B^0 \rightarrow D^{(*)-} \mu^+ \nu_\mu X$ , where the  $D$  mesons are reconstructed in  $D^- \rightarrow K^+ \pi^- \pi^-$  and  $D^{(*)-} \rightarrow \bar{D}^0 \pi^-$  with  $\bar{D}^0 \rightarrow K^+ \pi^-$ .
- 2 Uses semileptonic decays of  $B^0 \rightarrow D^- \mu^+ \nu_\mu X$  where the  $D^-$  mesons are reconstructed in  $D^- \rightarrow K^+ K^- \pi^-$ .
- 3 Measured using  $B^0 \rightarrow D^- \pi^+$  and  $B^0 \rightarrow J/\psi K^*(892)^0$  decays.
- 4 Measured using  $B^0 \rightarrow D^- \pi^+$ .
- 5 Uses opposite-side flavor-tagging with  $B \rightarrow D^{(*)} \mu \nu_\mu X$  events.
- 6 Measured using a simultaneous fit of the  $B^0$  lifetime and  $\bar{B}^0 B^0$  oscillation frequency  $\Delta m_d$  in the partially reconstructed  $B^0 \rightarrow D^{*-} \ell \nu$  decays.
- 7 Measurement performed using a combined fit of  $CP$ -violation, mixing and lifetimes.
- 8 Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.
- 9 AUBERT 03C uses a sample of approximately 14,000 exclusively reconstructed  $B^0 \rightarrow D^*(2010)^- \ell \nu$  and simultaneously measures the lifetime and oscillation frequency.
- 10 HASTINGS 03 measurement based on the time evolution of dilepton events. It also reports  $f_+/f_0 = 1.01 \pm 0.03 \pm 0.09$  and  $CPT$  violation parameters in  $B^0$ - $\bar{B}^0$  mixing.
- 11 ZHENG 03 data analyzed using partially reconstructed  $\bar{B}^0 \rightarrow D^{*-} \pi^+$  decay and a flavor tag based on the charge of the lepton from the accompanying  $B$  decay.
- 12 Uses a tagged sample of fully-reconstructed neutral  $B$  decays at  $\Upsilon(4S)$ .
- 13 Measured based on the time evolution of dilepton events in  $\Upsilon(4S)$  decays.
- 14 Data analyzed using partially reconstructed  $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}$  decay and a combination of flavor tags from the rest of the event.
- 15 Uses di-muon events.
- 16 Uses jet-charge and lepton-flavor tagging.
- 17 Uses  $\ell^- D^{*+} - \ell$  events.
- 18 Uses  $\pi$ - $B$  in the same side.
- 19 Uses  $\ell$ - $\ell$ .
- 20 Uses  $\ell$ - $Q_{\text{hem}}$ .
- 21 Uses  $\ell$ - $\ell$  with impact parameters.
- 22 Uses  $D^{*\pm} - Q_{\text{hem}}$ .
- 23 Uses  $\pi_s^\pm \ell - Q_{\text{hem}}$ .
- 24 Uses  $D^{*\pm} - \ell / Q_{\text{hem}}$ .
- 25 Uses  $D^{*\pm} \ell - Q_{\text{hem}}$ .
- 26 Uses  $D^{*\pm} - \ell$ .
- 27 AUBERT 02N result based on the same analysis and data sample reported in AUBERT 02I.
- 28 Uses a tagged sample of  $B^0$  decays reconstructed in the mode  $B^0 \rightarrow D^* \ell \nu$ .
- 29 Uses a tagged sample of fully-reconstructed hadronic  $B^0$  decays at  $\Upsilon(4S)$ .
- 30 ACCIARRI 98D combines results from  $\ell$ - $\ell$ ,  $\ell$ - $Q_{\text{hem}}$ , and  $\ell$ - $\ell$  with impact parameters.
- 31 ABREU 97N combines results from  $D^{*\pm} - Q_{\text{hem}}$ ,  $\ell - Q_{\text{hem}}$ ,  $\pi_s^\pm \ell - Q_{\text{hem}}$ , and  $\ell$ - $\ell$ .
- 32 ACKERSTAFF 97V combines results from  $\ell$ - $\ell$ ,  $\ell - Q_{\text{hem}}$ ,  $D^* - \ell$ , and  $D^{*\pm} - Q_{\text{hem}}$ .
- 33 BUSKULIC 97D combines results from  $D^{*\pm} - \ell / Q_{\text{hem}}$ ,  $\ell - Q_{\text{hem}}$ , and  $\ell$ - $\ell$ .
- 34 ABREU 96Q analysis performed using lepton, kaon, and jet-charge tags.
- 35 ALEXANDER 96V combines results from  $D^{*\pm} - \ell$  and  $D^{*\pm} \ell - Q_{\text{hem}}$ .
- 36 AKERS 95J combines results from charge measurement,  $D^{*\pm} \ell - Q_{\text{hem}}$  and  $\ell$ - $\ell$ .

$$x_d = \Delta m_{B^0} / \Gamma_{B^0}$$

------------	-----------------------	----	--------------------------

<sup>1</sup> Measurement uses decays  $B^0/\bar{B}^0 \rightarrow c\bar{c}K_S^0/K_L^0$ .

- <sup>2</sup> Measured using  $B^0 \rightarrow J/\psi K_S^0, J/\psi K_L^0, D^- \pi^+, D^{*-} \pi^+, D^{*-} \rho^+, \text{ and } D^{*-} \ell^+ \nu$  decays.
- <sup>3</sup> Measurement uses  $B^0/\bar{B}^0 \rightarrow \ell^+ X/\ell^- X$  decays. Assuming  $\Delta\Gamma = 0$ , the result becomes  $\text{Im}(z) = (-0.37 \pm 0.54) \times 10^{-2}$ .
- <sup>4</sup> Corresponds to 90% confidence range  $[-0.028, 0.104]$ .
- <sup>5</sup> Measured using inclusive dilepton events from  $B^0$  decay.

## CP VIOLATION PARAMETERS

### $\text{Re}(\epsilon_{B^0})/(1+|\epsilon_{B^0}|^2)$

CP impurity in  $B_d^0$  system. It is obtained from either  $a_{\ell\ell}$ , the charge asymmetry in like-sign dilepton events or  $a_{CP}$ , the time-dependent asymmetry of inclusive  $B^0$  and  $\bar{B}^0$  decays.

"OUR EVALUATION" is an average obtained by the Heavy Flavor Averaging Group (HFLAV) and described at <https://hflav.web.cern.ch/>. It is the result of a fit to  $B_d$  and  $B_s$  CP asymmetries, which includes the  $B_d$  measurements listed below and the  $B_s$  measurements listed in the  $B_s$  section, taking into account correlations between those measurements.

< 45	<sup>16</sup> BARTELT	93	CLE2 $e^+e^- \rightarrow \gamma(4S)$

<sup>1</sup> AAIJ 15F uses semileptonic  $B^0$  decays in the inclusive final states  $D^- \mu^+$  and  $D^{*-} \mu^+$ , where the  $D^-$  meson decays into the  $K^+ \pi^- \pi^-$  final state, and the  $D^{*-}$  meson into the  $\bar{D}^0 (\rightarrow K^+ \pi^-) \pi^-$  final state. Reports  $A_{SL}^d = (-0.02 \pm 0.19 \pm 0.30)\%$ , which equals to  $4\text{Re}(\epsilon_{B^0})/(1+|\epsilon_{B^0}|^2)$ .

<sup>2</sup> Uses the charge asymmetry in like-sign dilepton events. LEES 15A reports  $A_{SL}^d = (-3.9 \pm 3.5 \pm 1.9) \times 10^{-3}$ .

<sup>3</sup> ABAZOV 14 uses the dimuon charge asymmetry with different impact parameters from which it reports  $A_{SL}^d = (-0.62 \pm 0.42) \times 10^{-2}$ .

- <sup>4</sup> Uses  $B^0 \rightarrow D^{*-} X \ell^+ \nu_\ell$  and a kaon-tagged sample which yields measurement of  $A_{SL}^d = (0.06 \pm 0.17_{-0.32}^{+0.38})\%$ , corresponding to  $\Delta_{CP} = 1 - |q/p| = (0.29 \pm 0.84_{-1.61}^{+1.88}) \times 10^{-3}$ .
- <sup>5</sup> ABAZOV 12AC uses  $B^0 \rightarrow D^- \mu^+ X$  and  $B^0 \rightarrow D^*(2010)^- \mu^+ X$  decays without initial state flavor tagging which yields measurement of  $A_{SL}^d = (6.8 \pm 4.5 \pm 1.4) \times 10^{-3}$ .
- <sup>6</sup> AUBERT 06T reports  $|q/p| - 1 = (-0.8 \pm 2.7 \pm 1.9) \times 10^{-3}$ . We convert to  $(1 - |q/p|^2)/4$ .
- <sup>7</sup> Uses the charge asymmetry in like-sign dilepton events and reports  $|q/p| = 1.0005 \pm 0.0040 \pm 0.0043$ .
- <sup>8</sup> JAFFE 01 finds  $a_{\ell\ell} = 0.013 \pm 0.050 \pm 0.005$  and combines with the previous BEHRENS 00B independent measurement.
- <sup>9</sup> ABAZOV 11U uses the dimuon charge asymmetry with different impact parameters from which it reports  $A_{SL}^d = (-1.2 \pm 5.2) \times 10^{-3}$ .
- <sup>10</sup> Uses the dimuon charge asymmetry.
- <sup>11</sup> AUBERT 04C reports  $|q/p| = 1.029 \pm 0.013 \pm 0.011$  and we converted it to  $(1 - |q/p|^2)/4$ .
- <sup>12</sup> BARATE 01D measured by investigating time-dependent asymmetries in semileptonic and fully inclusive  $B_d^0$  decays.
- <sup>13</sup> BEHRENS 00B uses high-momentum lepton tags and partially reconstructed  $\bar{B}^0 \rightarrow D^{*+} \pi^-, \rho^-$  decays to determine the flavor of the  $B$  meson.
- <sup>14</sup> Data analyzed using the time-dependent asymmetry of inclusive  $B^0$  decay. The production flavor of  $B^0$  mesons is determined using both the jet charge and the charge of secondary vertex in the opposite hemisphere.
- <sup>15</sup> ACKERSTAFF 97U assumes  $CPT$  and is based on measuring the charge asymmetry in a sample of  $B^0$  decays defined by lepton and  $Q_{\text{hem}}$  tags. If  $CPT$  is not invoked,  $\text{Re}(\epsilon_B) = -0.006 \pm 0.010 \pm 0.006$  is found. The indirect  $CPT$  violation parameter is determined to  $\text{Im}(\delta B) = -0.020 \pm 0.016 \pm 0.006$ .
- <sup>16</sup> BARTELT 93 finds  $a_{\ell\ell} = 0.031 \pm 0.096 \pm 0.032$  which corresponds to  $|a_{\ell\ell}| < 0.18$ , which yields the above  $|\text{Re}(\epsilon_{B^0})/(1 + |\epsilon_{B^0}|^2)|$ .

### $A_{T/CP}$

$A_{T/CP}$  is defined as

$$\frac{P(\bar{B}^0 \rightarrow B^0) - P(B^0 \rightarrow \bar{B}^0)}{P(\bar{B}^0 \rightarrow B^0) + P(B^0 \rightarrow \bar{B}^0)},$$

the  $CPT$  invariant asymmetry between the oscillation probabilities  $P(\bar{B}^0 \rightarrow B^0)$  and  $P(B^0 \rightarrow \bar{B}^0)$ .

VALUE	DOCUMENT ID	TECN	COMMENT
<b>0.005 ± 0.012 ± 0.014</b>	<sup>1</sup> AUBERT	02K	BABR $e^+ e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> AUBERT 02K uses the charge asymmetry in like-sign dilepton events.

### $A_{CP}(B^0 \rightarrow D^*(2010)^+ D^-)$

$A_{CP}$  is defined as

$$\frac{B(\bar{B}^0 \rightarrow \bar{f}) - B(B^0 \rightarrow f)}{B(\bar{B}^0 \rightarrow \bar{f}) + B(B^0 \rightarrow f)},$$

the  $CP$ -violation charge asymmetry of exclusive  $B^0$  and  $\bar{B}^0$  decay.

 $C_{\pi\pi}(B^0 \rightarrow \pi^+\pi^-)$ 

$C_{\pi\pi}$  is defined as  $(1-|\lambda|^2)/(1+|\lambda|^2)$ , where the quantity  $\lambda=q/p \bar{A}_f/A_f$  is a phase convention independent observable quantity for the final state  $f$ . For details, see the review on "CP Violation" in the Reviews section.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

<sup>1</sup> Measurement based on  $B^0 \rightarrow J/\psi K_S^0$ ,  $B^0 \rightarrow \psi(2S) K_S^0$  with  $J/\psi \rightarrow \mu^+ \mu^-$ ,  $J/\psi \rightarrow e^+ e^-$  and  $\psi(2S) \rightarrow \mu^+ \mu^-$ .

<sup>2</sup> AAIJ 17BN provides the correlation coefficient  $\rho=0.42$  between the uncertainties of  $S_{B^0 \rightarrow c\bar{c}K^{(*)0}}$  ( $B^0 \rightarrow c\bar{c}K^{(*)0}$ ) and  $C_{c\bar{c}K^{(*)0}}$  ( $B^0 \rightarrow c\bar{c}K^{(*)0}$ ) measurements.

<sup>3</sup> Measurement based on  $B^0 \rightarrow J/\psi K_S^0$ ,  $B^0 \rightarrow \psi(2S) K_S^0$ ,  $B^0 \rightarrow J/\psi K_L^0$ , and  $B^0 \rightarrow \chi_{c1}(1P) K_S^0$  decays.

<sup>4</sup> Uses Dalitz plot analysis of  $B^0 \rightarrow K^0 \pi^+ \pi^-$  decays and the first of two equivalent solutions is used.

<sup>5</sup> Measurement based on  $B^0 \rightarrow c\bar{c}K^{(*)0}$  decays.

<sup>6</sup> Reports value of  $A$  of  $B^0 \rightarrow \psi(2S) K^0$  which is equal to  $-C$ .

<sup>7</sup> Reports value of  $A$  of  $B^0 \rightarrow J/\psi K^0$  which is equal to  $-C$ .

<sup>8</sup> Measurement based on  $152 \times 10^6 B\bar{B}$  pairs.

<sup>9</sup> Measurement based on  $227 \times 10^6 B\bar{B}$  pairs.

<sup>10</sup> Measured with both  $\eta_f = \pm 1$  samples.

<sup>11</sup> Measured with the high purity of  $\eta_f = -1$  samples.

## sin(2β)

For a discussion of *CP* violation, see the review on “*CP* Violation” in the Reviews section. sin(2β) is a measure of the *CP*-violating amplitude in the  $B_d^0 \rightarrow J/\psi(1S)K_S^0$ .

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

<sup>1</sup> Measurement based on  $B^0 \rightarrow J/\psi K_S^0$ ,  $B^0 \rightarrow \psi(2S)K_S^0$  with  $J/\psi \rightarrow \mu^+\mu^-$ ,  $J/\psi \rightarrow e^+e^-$  and  $\psi(2S) \rightarrow \mu^+\mu^-$ .

<sup>2</sup> AAIJ 17BN provides the correlation coefficient  $\rho = 0.42$  between the uncertainties of sin(2β) and cos(2β) measurements.

<sup>3</sup> Measurement based on  $B^0 \rightarrow J/\psi K_S^0$ ,  $B^0 \rightarrow \psi(2S)K_S^0$ ,  $B^0 \rightarrow J/\psi K_L^0$ , and  $B^0 \rightarrow \chi_{c1}(1P)K_S^0$  decays.

<sup>4</sup> SATO 12 uses 121 fb<sup>-1</sup> data collected on Y(5S) resonance. Uses the “*B* – π tagging” where  $B\pi^+$  and  $B\pi^-$  tagged  $J/\psi K_S^0$  events are compared.

<sup>5</sup> Uses Dalitz plot analysis of  $B^0 \rightarrow K^0\pi^+\pi^-$  decays and the first of two equivalent solutions.

<sup>6</sup> Measurement based on  $B^0 \rightarrow c\bar{c}K^{(*)0}$  decays.

<sup>7</sup> Measurement in which the  $J/\psi$  decays to hadrons or to muons that do not satisfy the standard identification criteria.

- 8 AFFOLDER 00C uses about 400  $B^0 \rightarrow J/\psi(1S)K_S^0$  events. The production flavor of  $B^0$  was determined using three tagging algorithms: a same-side tag, a jet-charge tag, and a soft-lepton tag.
- 9 BARATE 00Q uses 23 candidates for  $B^0 \rightarrow J/\psi(1S)K_S^0$  decays. A combination of jet-charge, vertex-charge, and same-side tagging techniques were used to determine the  $B^0$  production flavor.
- 10 ACKERSTAFF 98Z uses 24 candidates for  $B_d^0 \rightarrow J/\psi(1S)K_S^0$  decay. A combination of jet-charge and vertex-charge techniques were used to tag the  $B_d^0$  production flavor.
- 11 Based on  $B^0 \rightarrow \psi(2S)K_S^0$  decays.
- 12 Measurement based on  $152 \times 10^6 B\bar{B}$  pairs.
- 13 Measurement based on  $227 \times 10^6 B\bar{B}$  pairs.
- 14 ABE 02U result is based on the same analysis and data sample reported in ABE 01G.
- 15 ABE 02Z result is based on  $85 \times 10^6 B\bar{B}$  pairs.
- 16 AUBERT 02N result based on the same analysis and data sample reported in AUBERT 01B.
- 17 AUBERT 02P result is based on  $88 \times 10^6 B\bar{B}$  pairs.
- 18 First observation of  $CP$  violation in  $B^0$  meson system.
- 19 ABE 98U uses  $198 \pm 17 B_d^0 \rightarrow J/\psi(1S)K^0$  events. The production flavor of  $B^0$  was determined using the same side tagging technique.

### $C_{J/\psi(nS)K^0} (B^0 \rightarrow J/\psi(nS)K^0)$

“OUR EVALUATION” is an average using rescaled values of the data listed below. <sup>1</sup> Uses fully reconstructed  $B^0 \rightarrow D^{(*)\pm} \pi^\mp$  and  $D^\pm \rho^\mp$  decays and some theoretical assumptions.

<sup>2</sup> Uses a time dependent CP violation measurement in  $B^0 \rightarrow D^\mp \pi^\pm$  decays with external input and some theoretical assumptions.

<sup>3</sup> Combines the results from fully reconstructed and partially reconstructed  $D^{(*)} \pi$  events by taking weighted averages. Assumes that systematic errors from physics parameters and fit biases in the two measurements are 100% correlated.

<sup>4</sup> Uses partially reconstructed  $B^0 \rightarrow D^{*\pm} \pi^\mp$  decays and some theoretical assumptions.

<sup>5</sup> Uses fully reconstructed  $B^0 \rightarrow D^{(*)\pm} \pi^\mp$  decays and some theoretical assumptions, such as the SU(3) symmetry relation.

<sup>6</sup> Combining this measurement with the results from AUBERT 04V for fully reconstructed  $B^0 \rightarrow D^{(*)\pm} \pi^\mp$  and some theoretical assumptions, such as the SU(3) symmetry relation.

### $2\beta + \gamma$

VALUE (°)	DOCUMENT ID	TECN	COMMENT
<b>83 ± 53 ± 20</b>	<sup>1</sup> AUBERT	08AC BABR	$e^+ e^- \rightarrow \Upsilon(4S)$

<sup>1</sup> Used a time-dependent Dalitz-plot analysis of  $B^0 \rightarrow D^\mp K^0 \pi^\pm$  assuming the ratio of the  $b \rightarrow u$  and  $b \rightarrow c$  decay amplitudes to be 0.3.

**$\alpha$**

For angle  $\alpha(\phi_2)$  of the CKM unitarity triangle, see the review on “CP violation” in the reviews section.

”OUR EVALUATION” is provided by the Heavy Flavor Averaging Group (HFLAV).

<sup>1</sup> Based on an isospin analysis of the  $B \rightarrow \rho\rho$  system.

<sup>2</sup> Obtained using the time dependent analysis of  $B^0 \rightarrow a_1(1260)^\pm \pi^\mp$  and branching fraction measurements of  $B \rightarrow a_1(1260)K$  and  $B \rightarrow K_1\pi$ . Uses SU(3) flavor relations.

<sup>3</sup> The angle  $\alpha_{\text{eff}}$  is obtained using the measured CP parameters of  $B^0 \rightarrow a_1(1260)^\pm \pi^\mp$  and choosing one of the four solutions that is compatible with the result of SM-based fits.

<sup>4</sup> Obtained using isospin relation and selecting a solution closest to the CKM best fit average; the 90% CL allowed interval is  $59^\circ < \phi_2 (\equiv \alpha) < 115^\circ$ .

<sup>5</sup> Obtained using isospin relation and selecting a solution closest to the CKM best fit average; 90% CL allowed interval is  $79^\circ < \alpha < 123^\circ$ .

<sup>6</sup> Obtained from the measured CP parameters of the longitudinal polarization by selecting the solution closest to the CKM best fit central value of  $\alpha = 95^\circ - 98^\circ$ .

**CP VIOLATION PARAMETERS IN  $B^0 \rightarrow D^0 K^{*0}$  DECAY**

The parameters  $r_{B^0}$  and  $\delta_{B^0}$  are the magnitude ratio and strong phase difference between the amplitudes of  $A(B^0 \rightarrow D^0 K^{*0})$  and  $A(B^0 \rightarrow \bar{D}^0 K^{*0})$ . The measured observables and are defined as  $x_\pm = r_{B^0} \cos(\delta_{B^0} \pm \gamma)$  and  $y_\pm = r_{B^0} \sin(\delta_{B^0} \pm \gamma)$  where  $\gamma$  is the CKM angle  $\gamma$ .

”OUR EVALUATION” is provided by the Heavy Flavor Averaging Group (HFLAV). The CKM angle  $\gamma$  is listed in the  $B^+$  section for ”CP VIOLATION PARAMETERS IN  $B^+ \rightarrow DK^+$  AND SIMILAR DECAYS.”

## T and CPT VIOLATION PARAMETERS

Measured values of the  $T$ -,  $CP$ -, and  $CPT$ -asymmetry parameters, defined as the differences in  $S_{\alpha,\beta}^{\pm}$  and  $C_{\alpha,\beta}^{\pm}$  between symmetry-transformed transitions. The indices  $\alpha = \ell^+, \ell^-$  and  $\beta = K_S^0, K_L^0$  stand for reconstructed the flavor final state and the  $CP$  final states from  $\Upsilon(4S)$  decay. The sign  $\pm$  indicates whether the decay to the flavor final state  $\alpha$  occurs before or after the decay to the  $CP$  final state.

Alternatively, violations of  $CPT$  symmetry and Lorentz invariance are searched for by studying interference effects in  $B^0$  mixing. Results are expressed in terms of the standard model extension parameter  $\Delta a$ , which describes the difference between the couplings of the valence quarks within  $B^0$  meson with the Lorentz-violating fields.

<b>0.67<sup>+0.11</sup><sub>-0.11</sub> ± 0.04</b>	<sup>1</sup> AAIJ	14M LHCb	$pp$ at 7, 8 TeV

<sup>1</sup> Uses  $B(B^0 \rightarrow J/\psi(1S) K^0) = (0.928 \pm 0.013 \pm 0.037) \times 10^{-3}$  for normalisation and  $\mu^+ \mu^-$  as a lepton pair.

### $B(B^0 \rightarrow K_{0,2}^*(1430)^0 \mu^+ \mu^-) (1.10 < q^2 < 6.00 \text{ GeV}^2/c^4)$

VALUE (units $10^{-8}$ )	DOCUMENT ID	TECN	COMMENT
<b>4.02 ± 0.44 ± 0.31</b>	<sup>1,2</sup> AAIJ	16AP LHCb	$pp$ at 7, 8 TeV

<sup>1</sup> Measured the differential branching fraction and angular moments of the decay  $B^0 \rightarrow K^+ \pi^- \mu^+ \mu^-$  in the  $K^+ \pi^-$  invariant mass range  $1330 < m(K^+ \pi^-) < 1530 \text{ MeV}/c^2$ .

<sup>2</sup> The reported value is converted from the measured  $dB/dq^2 = (0.82 \pm 0.09 \pm 0.063) \times 10^{-8} (\text{GeV}^2/c^4)^{-1}$  by multiplying by the  $\Delta q^2 = 4.9 \text{ GeV}^2/c^4$  range.

### $F_H(B^0 \rightarrow K^0 \mu^+ \mu^-) (1.1 < q^2 < 6.0 \text{ GeV}^2/c^4)$

$F_H$  is a fractional contribution of (pseudo) scalar and tensor amplitudes to the decay width in the massless muon approximation.
