# New Heavy Bosons (*W'*, *Z'*, leptoquarks, etc.), Searches for

We list here various limits on charged and neutral heavy vector bosons (other than W's and Z's), heavy scalar bosons (other than Higgs bosons), vector or scalar leptoquarks, and axigluons. The latest unpublished results are described in "W' Searches" and "Z' Searches" reviews. For recent searches on scalar bosons which could be identified as Higgs bosons, see the listings in the Higgs boson section.

# MASS LIMITS for W' (Heavy Charged Vector Boson Other Than W) in Hadron Collider Experiments

Couplings of W' to quarks and leptons are taken to be identical with those of W. The following limits are obtained from  $p\overline{p}$  or  $pp \rightarrow W'X$  with W' decaying to the mode

indicated in the comments. New decay channels (e.g.,  $W' \rightarrow WZ$ ) are assumed to be suppressed. The most recent preliminary results can be found in the "W'-boson

## $W_R$ (Right-Handed W Boson) MASS LIMITS

Assuming a light right-handed neutrino, except for BEALL 82, LANGACKER 89B, and COLANGELO 91.  $g_R = g_L$  assumed. [Limits in the section MASS LIMITS for W' below are also valid for  $W_R$  if  $m_{\nu_R} \ll m_{W_R}$ .] Some limits assume manifest left-right symmetry, *i.e.*, the equality of left- and right Cabibbo-Kobayashi-Maskawa matrices. For a comprehensive review, see LANGACKER 89B. Limits on the  $W_L$ - $W_R$  mixing angle  $\zeta$  are found in the next section. Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino.

  - <sup>6</sup> MELCONIAN 07 measure the neutrino angular asymmetry in  $\beta^+$ -decays of polarized <sup>37</sup>K, stored in a magneto-optical trap. Result is consistent with SM prediction and does not constrain the  $W_L W_R$  mixing angle appreciably.
  - <sup>7</sup>SCHUMANN 07 limit is from measurements of the asymmetry  $\langle \vec{p}_{\nu} \cdot \sigma_{n} \rangle$  in the  $\beta$  decay of polarized neutrons. Zero mixing is assumed.
  - <sup>8</sup> CYBURT 05 limit follows by requiring that three light  $\nu_R$ 's decouple when  $T_{dec} > 140$  MeV. For different  $T_{dec}$ , the bound becomes  $M_{W_R} > 3.3$  TeV  $(T_{dec} / 140 \text{ MeV})^{3/4}$ .
  - <sup>9</sup>THOMAS 01 limit is from measurement of  $\beta^+$  polarization in decay of polarized <sup>12</sup>N. The listed limit assumes no mixing.
- $^{10}\,\rm ACKERSTAFF$  99D limit is from  $\tau$  decay parameters. Limit increase to 145 GeV for zero mixing.
- <sup>11</sup> BARENBOIM 98 assumes minimal left-right model with Higgs of SU(2)<sub>R</sub> in SU(2)<sub>L</sub> doublet. For Higgs in SU(2)<sub>L</sub> triplet,  $m_{W_R} > 1100$  GeV. Bound calculated from effect of corresponding  $Z_{LR}$  on electroweak data through  $Z-Z_{LR}$  mixing.
- <sup>12</sup> The quoted limit is from  $\mu$  decay parameters. BARENBOIM 97 also evaluate limit from  $K_I K_S$  mass difference.
- $^{13}$ STAHL 97 limit is from fit to au-decay parameters.
- <sup>14</sup> ALLET 96 measured polarization-asymmetry correlation in  ${}^{12}N\beta^+$  decay. The listed limit assumes zero *L-R* mixing.
- <sup>15</sup> KUZNETSOV 95 limit is from measurements of the asymmetry  $\langle \vec{p}_{\nu} \cdot \sigma_n \rangle$  in the  $\beta$  decay of polarized neutrons. Zero mixing assumed. See also KUZNETSOV 94B.
- <sup>16</sup> KUZNETSOV 94B limit is from measurements of the asymmetry  $\langle \vec{p}_{\nu} \cdot \sigma_n \rangle$  in the  $\beta$  decay of polarized neutrons. Zero mixing assumed.
- <sup>17</sup> BHATTACHARYYA 93 uses Z-Z' mixing limit from LEP '90 data, assuming a specific Higgs sector of  $SU(2)_L \times SU(2)_R \times U(1)$  gauge model. The limit is for  $m_t=200$  GeV and slightly improves for smaller  $m_t$ .
- $^{18}\,{\rm SEVERIJNS}$  93 measured polarization-asymmetry correlation in  $^{107}{\rm In}\,\beta^+$  decay. The listed limit assumes zero L-R mixing. Value quoted here is from SEVERIJNS 94 erratum.
- <sup>19</sup>IMAZATO 92 measure positron asymmetry in  $K^+

  - $\xi P_{\mu} > 0.990$  (90% CL). If  $W_R$  couples to  $u\overline{s}$  with full weak strength ( $V_{us}^R = 1$ ), the result corresponds to  $m_{W_R} > 653$  GeV. See their Fig. 4 for  $m_{W_R}$  limits for general  $|V_{us}^R|^2 = 1 |V_{ud}^R|^2$ .
- <sup>20</sup> POLAK 92B limit is from fit to muon decay parameters and is essentially determined by JODIDIO 86 data assuming  $\zeta$ =0. Supersedes POLAK 91.
- <sup>21</sup> AQUINO 91 limits obtained from neutron lifetime and asymmetries together with unitarity of the CKM matrix. Manifest left-right symmetry assumed. Stronger of the two limits also includes muon decay results.
- <sup>22</sup> COLANGELO 91 limit uses hadronic matrix elements evaluated by QCD sum rule and is less restrictive than BEALL 82 limit which uses vacuum saturation approximation. Manifest left-right symmetry assumed.

- <sup>23</sup> POLAK 91 limit is from fit to muon decay parameters and is essentially determined by JODIDIO 86 data assuming  $\zeta$ =0. Superseded by POLAK 92B.
- $^{24}$  BARBIERI 89B limit holds for  $m_{\nu_R} \leq 10$  MeV.
- $^{25}$  LANGACKER 89B limit is for any  $\nu_R$  mass (either Dirac or Majorana) and for a general class of right-handed quark mixing matrices.
- <sup>26</sup> BALKE 88 limit is for  $m_{\nu_{eR}} = 0$  and  $m_{\nu_{\mu R}} \leq 50$  MeV. Limits come from precise measurements of the muon decay asymmetry as a function of the positron energy.
- <sup>27</sup> JODIDIO 86 is the same TRIUMF experiment as STOKER 85 (and CARR 83); however, it uses a different technique. The results given here are combined results of the two techniques. The technique here involves precise measurement of the end-point  $e^+$ spectrum in the decay of the highly polarized  $\mu^+$ .
- <sup>28</sup> STOKER 85 is same TRIUMF experiment as CARR 83. Here they measure the decay  $e^+$  spectrum asymmetry above 46 MeV/c using a muon-spin-rotation technique. Assumed a light right-handed neutrino. Quoted limits are from combining with CARR 83.
- <sup>29</sup> BERGSMA 83 set limit  $m_{W_2}/m_{W_1}$  >1.9 at CL = 90%.
- <sup>30</sup> CARR 83 is TRIUMF experiment with a highly polarized  $\mu^+$  beam. Looked for deviation from V-A at the high momentum end of the decay  $e^+$  energy spectrum. Limit from previous world-average muon polarization parameter is  $m_{W_R}$  >240 GeV. Assumes a light right-handed neutrino.
- <sup>31</sup> BEALL 82 limit is obtained assuming that  $W_R$  contribution to  $K_L^0 K_S^0$  mass difference is smaller than the standard one, neglecting the top quark contributions. Manifest left-right symmetry assumed.

### Limits for $Z_{LR}$

 $Z_{LR}$  is the extra neutral boson in left-right symmetric models.  $g_L = g_R$  is assumed unless noted. Values in parentheses assume stronger constraint on the Higgs sector, usually motivated by specific left-right symmetric models (see the Note on the W'). Values in brackets are from cosmological and astrophysical considerations and assume a light right-handed neutrino. Direct search bounds assume decays to Standard Model fermions only, unless noted.

- <sup>22</sup> These authors claim that the nucleosynthesis bound on the effective number of light neutrinos ( $\delta N_{\nu} < 1$ ) constrains Z' masses if  $\nu_R$  is light ( $\lesssim 1$  MeV).
- $^{23}\,{\rm GRIFOLS}$  90 limit holds for  $m_{\nu_P}\,\lesssim$  1 MeV. See also GRIFOLS 90D, RIZZO 91.

### Indirect Constraints on Kaluza-Klein Gauge Bosons

Bounds on a Kaluza-Klein excitation of the Z boson or photon in d=1 extra dimension. These bounds can also be interpreted as a lower bound on 1/R, the size of the extra dimension. Unless otherwise stated, bounds assume all fermions live on a single brane and all gauge fields occupy the 4+d-dimensional bulk. See also the section on "Extra Dimensions" in the "Searches" Listings in this Review.

 $^1$  MUECK 02 limit is  $2\sigma$  and is from global electroweak fit ignoring correlations among observables. Higgs is assumed to be confined on the brane and its mass is fixed. For scenarios of bulk Higgs, of brane-SU(2)<sub>L</sub>, bulk-U(1)<sub>Y</sub>, and of bulk-SU(2)<sub>L</sub>, brane-U(1)<sub>Y</sub>, the corresponding limits are > 4.6 TeV, > 4.3 TeV and > 3.0 TeV, respectively.

<sup>2</sup>Bound is derived from limits on  $e\nu q q'$  contact interaction, using data from HERA and

the Tevatron. <sup>3</sup>Bound holds only if first two generations of quarks lives on separate branes. If quark mixing is not complex, then bound lowers to 400 TeV from  $\Delta m_{\mathcal{K}}$ .

<sup>4</sup>See Figs. 1 and 2 of DELGADO 00 for several model variations. Special boundary conditions can be found which permit KK states down to 950 GeV and that agree with the measurement of  $Q_{W}(Cs)$ . Quoted bound assumes all Higgs bosons confined to brane; placing one Higgs doublet in the bulk lowers bound to 2.3 TeV.

<sup>5</sup> Bound is derived from global electroweak analysis assuming the Higgs field is trapped on the matter brane. If the Higgs propagates in the bulk, the bound increases to 3.8 TeV.

 $^{6}$ Bound is derived from global electroweak analysis but considering only presence of the

KK W bosons. <sup>7</sup>Global electroweak analysis used to obtain bound independent of position of Higgs on brane or in bulk.

<sup>8</sup> Bounds from effect of KK states on  $G_F$ ,  $\alpha$ ,  $M_W$ , and  $M_Z$ . Hard cutoff at string scale determined using gauge coupling unification. Limits for d=2,3,4 rise to 3.5, 5.7, and 7.8 TeV.

<sup>9</sup> Bound obtained for Higgs confined to the matter brane with  $m_H$ =500 GeV. For Higgs in the bulk, the bound increases to 3.5 TeV.

<sup>2</sup> DERRICK 86 found no deviation from the Standard Model Bhabha scattering at  $E_{cm}$ = 29 GeV and set limits on the possible scalar boson  $e^+e^-$  coupling. See their figure 4 for excluded region in the  $\Gamma(X^0 \rightarrow e^+e^-) \cdot m_{X^0}$  plane. Electronic chiral invariance requires a parity doublet of  $X^0$ , in which case the limit applies for  $\Gamma(X^0 \rightarrow e^+e^-) =$ 3 MeV.
