

$T_{c\bar{c}s1}(4000)$ $I(J^P) = \frac{1}{2}(1^+)$

OMMITTED FROM SUMMARY TABLE
was $Z_{cs}(4000)$

Properties incompatible with a $q\bar{q}$ structure (exotic state). See the review on "Heavy Non- $q\bar{q}$ Mesons."

Seen by AAIJ 21E in $B^+ \rightarrow T_{c\bar{c}s1}(4000)^+ \phi$ with $T_{c\bar{c}s1}(4000)^+ \rightarrow J/\psi K^+$ using an amplitude analysis of $B^+ \rightarrow J/\psi \phi K^+$ with a significance (accounting for systematic uncertainties) of 15σ .

The $J^P = 1^+$ assignment is favored with high significance. ABLIKIM 21G also reports a $J^P = 1^+$ $T_{c\bar{c}s1}$ state in this mass region using $e^+ e^- \rightarrow K^+(D_s^- D^{*0} + D_s^{*-} D^0)$ with a significance of 5.3σ . The incompatible values for the widths reported by AAIJ 21E and ABLIKIM 21G could either indicate the existence of two separate states or possibly be explained in a coupled channel model (see ORTEGA 21).
