$K^*(892)$ MASSES AND MASS DIFFERENCES

Unrealistically small errors have been reported by some experiments. We use simple “realistic” tests for the minimum errors on the determination of a mass and width from a sample of N events:

$$\delta_{\min}(m) = \frac{\Gamma}{\sqrt{N}}, \quad \delta_{\min}(\Gamma) = 4 \frac{\Gamma}{\sqrt{N}}. \quad (1)$$

We consistently increase unrealistic errors before averaging. For a detailed discussion, see the 1971 edition of this Note.

WEIGHTED AVERAGE
 47.1 ± 0.5 (Error scaled by 2.0)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

NEUTRAL ONLY (MeV)

- ¹ Taking also into account the $K_0^*(1430)^0$ and $K_2^*(1430)^0$.
- ² Taking into account the $K^*(892)^0$, *S*-wave and *P*-wave ($K^*(1410)^0$).
- ³ From the isobar model with a complex pole for the κ .
- ⁴ Fit to $K\pi$ mass spectrum includes a non-resonant scalar component.
- ⁵ Inclusive reaction. Complicated background and phase-space effects.
- ⁶ Width errors enlarged by us to $4 \times \Gamma/\sqrt{N}$; see note.
- ⁷ Number of events in peak reevaluated by us.
- ⁸ For transverse momenta between 0.6 and 0.8 GeV/c and rapidity $0 < y < 0.5$.

⁹ From a Dalitz plot analysis in an isobar model with charged and neutral $K^*(892)$ masses and widths floating.

¹⁰ This value comes from a fit with χ^2 of 178/117.

¹¹ Systematic uncertainties not estimated.

CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 15 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 36.3$ for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.
