

# LIGHT UNFLAVORED MESONS

## ( $S = C = B = 0$ )

For  $l = 1$  ( $\pi, b, \rho, a$ ):  $u\bar{d}, (u\bar{u}-d\bar{d})/\sqrt{2}, d\bar{u}$ ;  
for  $l = 0$  ( $\eta, \eta', h, h', \omega, \phi, f, f'$ ):  $c_1(u\bar{u} + d\bar{d}) + c_2(s\bar{s})$

NODE=MXXX005

NODE=M014

### $f_0(500)$

$$I^G(J^{PC}) = 0^+(0^{++})$$

also known as  $\sigma$ ; was  $f_0(600)$   
See the related review(s):  
[Scalar Mesons below 2 GeV](#)

### $f_0(500)$ T-MATRIX POLE $\sqrt{s}$

Note that  $\Gamma \approx 2 \operatorname{Im}(\sqrt{s_{\text{pole}}})$ .

| 1 S-matrix pole; 8595 events.                                                                                                                                                                         |                  |                                                       |
| 2 Applying the chiral unitary approach at NLO to the $K_{e4}$ data of BATLEY 10 and $\pi N \rightarrow \pi\pi N$ data of HYAMS 73, GRAYER 74, and PROTOPOPOESCU 73.                                   |                  |                                                       |
| 3 Uses the $K_{e4}$ data of BATLEY 10C and the $\pi N \rightarrow \pi\pi N$ data of HYAMS 73, GRAYER 74, and PROTOPOPOESCU 73.                                                                        |                  |                                                       |
| 4 Analytic continuation using Roy equations.                                                                                                                                                          |                  |                                                       |
| 5 Analytic continuation using GKPY equations.                                                                                                                                                         |                  |                                                       |
| 6 Using Roy equations.                                                                                                                                                                                |                  |                                                       |
| 7 Average of three variants of the analytic K-matrix model. Uses the $K_{e4}$ data of BATLEY 08A and the $\pi N \rightarrow \pi\pi N$ data of HYAMS 73 and GRAYER 74.                                 |                  |                                                       |
| 8 Average of the analyses of three data sets in the K-matrix model. Uses the data of BATLEY 08A, HYAMS 73, and GRAYER 74, partially of COHEN 80 or ETKIN 82B.                                         |                  |                                                       |
| 9 From the $K_{e4}$ data of BATLEY 08A and $\pi N \rightarrow \pi\pi N$ data of HYAMS 73.                                                                                                             |                  |                                                       |
| 10 From the $K_{e4}$ data of BATLEY 08A and $\pi N \rightarrow \pi\pi N$ data of PROTOPOPOESCU 73, GRAYER 74, and ESTABROOKS 74.                                                                      |                  |                                                       |
| 11 From a mean of three different $f_0(500)$ parametrizations. Uses 40k events.                                                                                                                       |                  |                                                       |
| 12 From an isobar model using 2.6k events.                                                                                                                                                            |                  |                                                       |
| 13 Reanalysis of ABLIKIM 04A, PISLAK 01, and HYAMS 73 data.                                                                                                                                           |                  |                                                       |
| 14 Using the N/D method.                                                                                                                                                                              |                  |                                                       |
| 15 From the solution of the Roy equation (ROY 71) for the isoscalar S-wave and using a phase-shift analysis of HYAMS 73 and PROTOPOPOESCU 73 data.                                                    |                  |                                                       |
| 16 Reanalysis of the data from PROTOPOPOESCU 73, ESTABROOKS 74, GRAYER 74, ROSSELET 77, PISLAK 03, and AKHMETSHIN 04.                                                                                 |                  |                                                       |
| 17 From a mean of six different analyses and $f_0(500)$ parameterizations.                                                                                                                            |                  |                                                       |
| 18 Using data on $\psi(2S) \rightarrow J/\psi\pi\pi$ from BAI 00E and on $\Upsilon(nS) \rightarrow \Upsilon(mS)\pi\pi$ from BUTLER 94B and ALEXANDER 98.                                              |                  |                                                       |
| 19 From a combined analysis of HYAMS 73, AUGUSTIN 89, AITALA 01B, and PISLAK 01.                                                                                                                      |                  |                                                       |
| 20 A similar analysis (KOMADA 01) finds $(580^{+79}_{-30}) - i(190^{+107}_{-49})$ MeV.                                                                                                                |                  |                                                       |
| 21 Coupled channel reanalysis of BATON 70, BENSINGER 71, BAILLON 72, HYAMS 73, HYAMS 75, ROSSELET 77, COHEN 80, and ETKIN 82B using the uniformizing variable.                                        |                  |                                                       |
| 22 Using the inverse amplitude method and data of ESTABROOKS 73, GRAYER 74, and PROTOPOPOESCU 73.                                                                                                     |                  |                                                       |
| 23 Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.                                                                                |                  |                                                       |
| 24 Average and spread of 4 variants (“up” and “down”) of KAMINSKI 97B 3-channel model.                                                                                                                |                  |                                                       |
| 25 Uses data from BEIER 72B, OCHS 73, HYAMS 73, GRAYER 74, ROSSELET 77, CASON 83, ASTON 88, and ARMSTRONG 91B. Coupled channel analysis with flavor symmetry and all light two-pseudoscalars systems. |                  |                                                       |
| 26 Demonstrates explicitly that $f_0(500)$ and $f_0(1370)$ are two different poles.                                                                                                                   |                  |                                                       |
| 27 Analysis of data from FALVARD 88.                                                                                                                                                                  |                  |                                                       |
| 28 Analysis of data from OCHS 73, ESTABROOKS 75, ROSSELET 77, and MUKHIN 80.                                                                                                                          |                  |                                                       |
| 29 Analysis of data from OCHS 73, GRAYER 74, and ROSSELET 77.                                                                                                                                         |                  |                                                       |
| 30 Coupled-channel analysis using data from PROTOPOPOESCU 73, HYAMS 73, HYAMS 75, GRAYER 74, ESTABROOKS 74, ESTABROOKS 75, FROGGATT 77, CORDEN 79, BISWAS 81.                                         |                  |                                                       |
| 31 Analysis of data from APEL 72C, GRAYER 74, CASON 76, PAWLICKI 77. Includes spread and errors of 4 solutions.                                                                                       |                  |                                                       |
| 32 Analysis of data from BATON 70, BENSINGER 71, COLTON 71, BAILLON 72, PROTOPOPOESCU 73, and WALKER 67.                                                                                              |                  |                                                       |

| 414±20  | 38 AUGUSTIN     | 89 | DM2  |                                                                                                            |

33 Statistical uncertainty only.

34 A similar analysis (KOMADA 01) finds  $526^{+48}_{-37}$  MeV.

35 From the best fit of the Dalitz plot.

36  $6\sigma$  effect, no PWA.

37 Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.

38 Breit-Wigner fit to S-wave intensity measured in  $\pi N \rightarrow \pi^-\pi^+N$  on polarized targets. The fit does not include  $f_0(980)$ .

39 Uses data from ASTON 88, OCHS 73, HYAMS 73, ARMSTRONG 91B, GRAYER 74, CASON 83, ROSSELET 77, and BEIER 72B. Coupled channel analysis with flavor symmetry and all light two-pseudoscalars systems.

40 Also observed by ASNER 00 in  $\tau^- \rightarrow \pi^-\pi^0\pi^0\nu_\tau$  decays.

41 Uses  $\pi^0\pi^0$  data from ANISOVICH 94, AMSLER 94D, and ALDE 95B,  $\pi^+\pi^-$  data from OCHS 73, GRAYER 74 and ROSSELET 77, and  $\eta\eta$  data from ANISOVICH 94.

42 The pole is on Sheet III. Demonstrates explicitly that  $f_0(500)$  and  $f_0(1370)$  are two different poles.

43 Analysis of data from OCHS 73, ESTABROOKS 75, ROSSELET 77, and MUKHIN 80.

## THE $\rho(770)$

Updated September 2019 by S. Eidelman (Novosibirsk) and G. Venanzoni (Pisa).

The determination of the parameters of the  $\rho(770)$  is beset with many difficulties because of its large width. In physical region fits, the line shape does not correspond to a relativistic Breit-Wigner function with a  $P$ -wave width, but requires some additional shape parameter. This dependence on parameterization was demonstrated long ago [1]. Bose-Einstein correlations are another source of shifts in the  $\rho(770)$  line shape, particularly in multiparticle final-state systems [2].

The same model dependence afflicts any other source of resonance parameters, such as the energy dependence of the phase shift  $\delta_1^1$ , or the pole position. It is, therefore, not surprising that a study of  $\rho(770)$  dominance in the decays of the  $\eta$  and  $\eta'$  reveals the need for specific dynamical effects, in addition to the  $\rho(770)$  pole [3,4].

The cleanest determination of the  $\rho(770)$  mass and width comes from  $e^+e^-$  annihilation and  $\tau$ -lepton decays. Analysis of ALEPH [5] showed that the charged  $\rho(770)$  parameters measured from  $\tau$ -lepton decays are consistent with those of the neutral one determined from  $e^+e^-$  data [6]. This conclusion is qualitatively supported by the later studies of CLEO [7] and Belle [8]. However, comparison of the two-pion mass spectrum in  $\tau$  decays from OPAL [9], CLEO [7], and ALEPH [10,11], and the  $e^+e^- \rightarrow \pi^+\pi^-$  cross section from CMD-2 [12,13], showed significant discrepancies between the two shapes which can be as high as 10% above the  $\rho$  meson [14,15]. This discrepancy remains after measurements of the two-pion cross section in  $e^+e^-$  annihilation at KLOE [16,17,18,19], SND [20,21], BaBar [22] and, more recently BESIII [23]. The effect is not accounted for by isospin breaking [24,25,26,27], but the accuracy of its calculation may be overestimated [28,29].

This problem seems to be solved after a recent analysis in [30] which showed that after correcting the  $\tau$  data for the missing  $\rho-\gamma$  mixing contribution, besides the other known isospin symmetry violating corrections, the  $\pi\pi$   $I=1$  part of the hadronic vacuum polarization contribution to the muon  $g-2$  is fully compatible between  $\tau$  based and  $e^+e^-$  based evaluations.

The global fit of the whole set of the  $\rho$ ,  $\omega$ , and  $\phi$  decays, taking into account mixing effects in the hidden local symmetry model, also showed consistency of the data on  $\tau$  decays to two pions and  $e^+e^-$  annihilation [31,32]. However, because of the progress in  $e^+e^-$  data, the  $\tau$  input is now less precise and less reliable due to additional theoretical uncertainties [33] decreasing importance of  $\tau$  versus  $e^+e^-$  comparison for the determination of  $\rho(770)$  parameters and other applications, like, e.g., calculations of hadronic vacuum polarization.

<sup>1</sup> From a fit of the cross section in the energy range  $0.525 < \sqrt{s} < 0.883$  GeV parameterized by the sum of the Breit-Wigner amplitudes for the  $\rho(770)$ ,  $\omega$  and  $\rho(1450)$  resonances.

<sup>2</sup> Using the GOUNARIS 68 parametrization with the complex phase of the  $\rho$ - $\omega$  interference and leaving the masses and widths of the  $\rho(1450)$ ,  $\rho(1700)$ , and  $\rho(2150)$  resonances as free parameters of the fit.

<sup>3</sup> A combined fit of AKHMETSHIN 07, AULCHENKO 06, and AULCHENKO 05.

<sup>4</sup> Supersedes ACHASOV 05A.

<sup>5</sup> A fit of the SND data from 400 to 1000 MeV using parameters of the  $\rho(1450)$  and  $\rho(1700)$  from a fit of the data of BARKOV 85, BISELLO 89 and ANDERSON 00A.

<sup>6</sup> Using the GOUNARIS 68 parametrization with the complex phase of the  $\rho$ - $\omega$  interference.

<sup>7</sup> Update of AKHMETSHIN 02.

<sup>8</sup> Assuming  $m_{\rho^+} = m_{\rho^-}$ ,  $\Gamma_{\rho^+} = \Gamma_{\rho^-}$ .

<sup>9</sup> From the GOUNARIS 68 parametrization of the pion form factor.

- 10 Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUB-NICKA 10 to analyze the data of LEES 12G and ABLIKIM 16C.
- 11 Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUB-NICKA 10 to analyze the data of ACHASOV 06, AKHMETSHIN 07, AUBERT 09AS, and AMBROSINO 11A.
- 12 Assuming  $m_{\rho^+} = m_{\rho^-} = m_{\rho^0}$ ,  $\Gamma_{\rho^+} = \Gamma_{\rho^-} = \Gamma_{\rho^0}$ .
- 13 Without limitations on masses and widths.
- 14 Assuming  $m_{\rho^0} = m_{\rho^\pm}$ ,  $g_{\rho^0\pi\pi} = g_{\rho^\pm\pi\pi}$ .
- 15 Using the data of BARKOV 85 in the hidden local symmetry model.
- 16 From the fit to  $e^+e^- \rightarrow \pi^+\pi^-$  data from the compilations of HEYN 81 and BARKOV 85, including the GOUNARIS 68 parametrization of the pion form factor.
- 17 A fit of BARKOV 85 data assuming the direct  $\omega\pi\pi$  coupling.
- 18 Applying the S-matrix formalism to the BARKOV 85 data.
- 19 Includes BARKOV 85 data. Model-dependent width definition.

### $\rho(770)$ RANGE PARAMETER

NODE=M009R

NODE=M009R

The range parameter  $R$  enters an energy-dependent correction to the width, of the form  $(1 + q_r^2 R^2) / (1 + q^2 R^2)$ , where  $q$  is the momentum of one of the pions in the  $\pi\pi$  rest system. At resonance,  $q = q_r$ .

OCCUR=3

<sup>1</sup> From a fit of the cross section in the energy range  $0.525 < \sqrt{s} < 0.883$  GeV parameterized by the sum of the Breit-Wigner amplitudes for the  $\rho(770)$ ,  $\omega$  and  $\rho(1450)$  resonances.

<sup>2</sup> Using the GOUNARIS 68 parametrization with the complex phase of the  $\rho$ - $\omega$  interference and leaving the masses and widths of the  $\rho(1450)$ ,  $\rho(1700)$ , and  $\rho(2150)$  resonances as free parameters of the fit.

<sup>3</sup> A combined fit of AKHMETSHIN 07, AULCHENKO 06, and AULCHENKO 05.

<sup>4</sup> Supersedes ACHASOV 05A.

<sup>5</sup> A fit of the SND data from 400 to 1000 MeV using parameters of the  $\rho(1450)$  and  $\rho(1700)$  from a fit of the data of BARKOV 85, BISELLO 89 and ANDERSON 00A.

<sup>6</sup> Using the GOUNARIS 68 parametrization with the complex phase of the  $\rho$ - $\omega$  interference.

<sup>7</sup> From a fit in the energy range 0.61 to 0.96 GeV. Update of AKHMETSHIN 02.

<sup>8</sup> Assuming  $m_{\rho^+} = m_{\rho^-}$ ,  $\Gamma_{\rho^+} = \Gamma_{\rho^-}$ .

<sup>9</sup> From the GOUNARIS 68 parametrization of the pion form factor.

<sup>10</sup> Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of LEES 12G and ABLIKIM 16C.

<sup>11</sup> Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of ACHASOV 06, AKHMETSHIN 07, AUBERT 09AS, and AMBROSINO 11A.

<sup>12</sup> Assuming  $m_{\rho^+} = m_{\rho^-} = m_{\rho^0}$ ,  $\Gamma_{\rho^+} = \Gamma_{\rho^-} = \Gamma_{\rho^0}$ .

<sup>13</sup> Without limitations on masses and widths.

<sup>14</sup> Assuming  $m_{\rho^0} = m_{\rho^\pm}$ ,  $g_{\rho^0\pi\pi} = g_{\rho^\pm\pi\pi}$ .

<sup>15</sup> Using the data of BARKOV 85 in the hidden local symmetry model.

<sup>16</sup> From the fit to  $e^+e^- \rightarrow \pi^+\pi^-$  data from the compilations of HEYN 81 and BARKOV 85, including the GOUNARIS 68 parametrization of the pion form factor.

<sup>17</sup> A fit of BARKOV 85 data assuming the direct  $\omega\pi\pi$  coupling.

<sup>18</sup> Applying the S-matrix formalism to the BARKOV 85 data.

<sup>19</sup> Includes BARKOV 85 data. Model-dependent width definition.

| $\Gamma_{16} \quad \pi^+\pi^-\pi^0\pi^0$ | $(1.6 \pm 0.8) \times 10^{-5}$                   |                                   |
| $\Gamma_{17} \quad \pi^0e^+e^-$          | $< 1.2 \times 10^{-5}$                           | CL=90%                            |
| $\Gamma_{18} \quad \eta e^+e^-$          |                                                  |                                   |

[a] The  $\omega\rho$  interference is then due to  $\omega\rho$  mixing only, and is expected to be small. If  $e\mu$  universality holds,  $\Gamma(\rho^0 \rightarrow \mu^+\mu^-) = \Gamma(\rho^0 \rightarrow e^+e^-) \times 0.99785$ .

### CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 10 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 10.7$  for 8 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

## CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 7 branching ratios uses 21 measurements and one constraint to determine 9 parameters. The overall fit has a  $\chi^2 = 9.5$  for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

 $\pi^- \text{Cu} \rightarrow \mu^+\mu^-\pi^-\text{Cu}$ 

• • • We do not use the following data for averages, fits, limits, etc. • • •

8.2<sup>+1.6</sup><sub>-3.6</sub> <sup>1</sup> ROTHWELL 69 CNTR Photoproduction5.6 ±1.5 <sup>2</sup> WEHMANN 69 OSPK 12  $\pi^- \text{C, Fe}$ 9.7<sup>+3.1</sup><sub>-3.3</sub> <sup>3,4</sup> HYAMS 67 OSPK 11  $\pi^- \text{Li, H}$ <sup>1</sup> Possibly large  $\rho$ - $\omega$  interference leads us to increase the minus error.NODE=M009R5;LINKAGE=R  
NODE=M009R5;LINKAGE=W<sup>2</sup> Result contains  $11 \pm 11\%$  correction using SU(3) for central value. The error on the correction takes account of possible  $\rho$ - $\omega$  interference and the upper limit agrees with the upper limit of  $\omega \rightarrow \mu^+\mu^-$  from this experiment.<sup>3</sup> But he even enlarges his error to take residual  $\omega$  contamination into account. Since his value is high, seems the other experiments also can't have too many  $\omega$ 's. But maybe Hyams has additional  $\mu$ 's from  $\rho \rightarrow \pi\pi$ , decaying  $\pi$ 's.

NODE=M009R5;LINKAGE=01

<sup>4</sup> HYAMS 67's mass resolution is 20 MeV. The  $\omega$  region was excluded.

OCCUR=2

OCCUR=2

<sup>1</sup> Update of AKHMETSHIN 00C.<sup>2</sup> From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the  $\pi^+ \pi^- \pi^0$  and ANTONELLI 92 on the  $\omega \pi^+ \pi^-$  final states. Supersedes ACHASOV 99E and ACHASOV 02E.<sup>3</sup> From the  $\eta \rightarrow \gamma \gamma$  decay.<sup>4</sup> From the  $\eta \rightarrow 3\pi^0$  decay.<sup>5</sup> Observed by threshold-crossing technique. Mass resolution = 4.8 MeV FWHM.<sup>6</sup> The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization. Inclusion of vacuum polarization gives  $782.736 \pm 0.024$  MeV.<sup>7</sup> The  $\omega$  mass was extracted from a dispersively improved Breit-Wigner parameterization, the  $\omega$  width fixed at  $8.49 \pm 0.08$  MeV. The value does not include vacuum polarization which would shift the mass to  $781.81 \pm 0.09 \pm 0.03$  MeV. The mixing parameter is assumed real valued.<sup>8</sup> The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization.<sup>9</sup> From the  $\rho - \omega$  interference in the  $\pi^+ \pi^-$  mass spectrum using the Breit-Wigner for the  $\omega$  and leaving its mass and width as free parameters of the fit.<sup>10</sup> Systematic uncertainties underestimated.<sup>11</sup> Systematic uncertainties not estimated.<sup>12</sup> From best-resolution sample of COYNE 71.<sup>13</sup> From  $\omega - \rho$  interference in the  $\pi^+ \pi^-$  mass spectrum assuming  $\omega$  width 12.6 MeV.NODE=M001M;LINKAGE=PT

NODE=M001W  
NEW

OCCUR=2

<sup>1</sup> Update of AKHMETSHIN 00C.

<sup>2</sup> From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the  $\pi^+\pi^-\pi^0$  and ANTONELLI 92 on the  $\omega\pi^+\pi^-$  final states. Supersedes ACHASOV 99E and ACHASOV 02E.

<sup>3</sup> The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization. Inclusion of vacuum polarization gives 8.63 ± 0.05 MeV.

<sup>4</sup> The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization.

<sup>5</sup> From the  $\rho-\omega$  interference in the  $\pi^+\pi^-$  mass spectrum using the Breit-Wigner for the  $\omega$  and leaving its mass and width as free parameters of the fit.

<sup>6</sup> Systematic uncertainties underestimated.

<sup>7</sup> Relativistic Breit-Wigner includes radiative corrections. Systematic uncertainties not estimated.

<sup>8</sup> Systematic uncertainties not estimated.

<sup>9</sup> Observed by threshold-crossing technique. Mass resolution = 4.8 MeV FWHM.

**CONSTRAINED FIT INFORMATION**

An overall fit to 15 branching ratios uses 49 measurements and one constraint to determine 10 parameters. The overall fit has a  $\chi^2 = 48.2$  for 40 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

OCCUR=3  
OCCUR=2

- <sup>1</sup> A combined fit of AKHMETSHIN 07, AULCHENKO 06, and AULCHENKO 05.
- <sup>2</sup> Update of AKHMETSHIN 02.
- <sup>3</sup> From the  $m_{\pi^+\pi^-}$  spectrum taking into account the interference of the  $\rho\pi$  and  $\omega\pi$  amplitudes.
- <sup>4</sup> From a fit to  $\pi^+\pi^-$  mass using  $\rho(770)$  (parametrized with the Gounaris-Sakurai approach),  $\omega(782)$ , and box anomaly components.
- <sup>5</sup> ABLIKIM 18C reports  $[\Gamma(\omega(782) \rightarrow \pi^+\pi^-)/\Gamma_{\text{total}}] \times [B(\eta'(958) \rightarrow \omega\gamma)] = (3.25 \pm 0.21 \pm 0.52) \times 10^{-4}$  which we divide by our best value  $B(\eta'(958) \rightarrow \omega\gamma) = (2.52 \pm 0.07) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.
- <sup>6</sup> From a fit to  $\pi^+\pi^-$  mass using  $\rho(770)$  (parametrized with the Gounaris-Sakurai approach),  $\omega(782)$ , and  $\rho(1450)$  components.
- <sup>7</sup> ABLIKIM 18C reports  $[\Gamma(\omega(782) \rightarrow \pi^+\pi^-)/\Gamma_{\text{total}}] \times [B(\eta'(958) \rightarrow \omega\gamma)] = (3.22 \pm 0.21 \pm 0.52) \times 10^{-4}$  which we divide by our best value  $B(\eta'(958) \rightarrow \omega\gamma) = (2.52 \pm 0.07) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.
- <sup>8</sup> Dispersive analysis. Value extracted from average of data from AUBERT 09AS, AKHMETSHIN 07, ACHASOV 06, AMBROSINO 11A, BABUSCI 13D, ABLIKIM 16B normalised by PDG 16 evaluation for  $\Gamma(\omega \rightarrow e^+e^-)$ .
- <sup>9</sup> Using  $\Gamma(\omega \rightarrow e^+e^-)$  from the 2004 Edition of this Review (PDG 04).
- <sup>10</sup> Using the data of AKHMETSHIN 02 in the hidden local symmetry model.
- <sup>11</sup> Using the data of BARKOV 85.
- <sup>12</sup> Using the data of BARKOV 85 in the hidden local symmetry model.
- <sup>13</sup> From a model-dependent analysis assuming complete coherence.
- <sup>14</sup> Re-evaluated under  $\Gamma(\pi^+\pi^-)/\Gamma(\pi^+\pi^-\pi^0)$  by BEHREND 71 using more accurate  $\omega \rightarrow \rho$  photoproduction cross-section ratio.

<sup>1</sup> The fitted width of these data is 160 MeV in agreement with present average, thus the  $\omega$  contribution is overestimated. Assuming  $\rho$  width 145 MeV.

<sup>2</sup> Significant interference effect observed. NB of  $\omega \rightarrow 3\pi$  comes from an extrapolation.

<sup>3</sup> ROOS 70 combines ABRAMOVICH 70 and BIZZARRI 70.

NODE=M001R19  
NODE=M001R19

<sup>1</sup> No flat  $\eta\eta\gamma$  background assumed.

<sup>2</sup> Solution corresponding to constructive  $\omega$ - $\rho$  interference.

<sup>3</sup> ACHASOV 07B reports  $[\Gamma(\omega(782) \rightarrow \eta\gamma)/\Gamma_{\text{total}}] \times [B(\omega(782) \rightarrow e^+e^-)] = (3.10 \pm 0.31 \pm 0.11) \times 10^{-8}$  which we divide by our best value  $B(\omega(782) \rightarrow e^+e^-) = (7.39 \pm 0.19) \times 10^{-5}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Supersedes ACHASOV 00D and ACHASOV 06A.

<sup>4</sup> Not independent of the corresponding  $\Gamma(e^+e^-) \times \Gamma(\eta\gamma)/\Gamma_{\text{total}}^2$ .

<sup>5</sup> Using  $B(\omega \rightarrow e^+e^-) = (7.14 \pm 0.13) \times 10^{-5}$  and  $B(\eta \rightarrow \gamma\gamma) = 39.43 \pm 0.26\%$ .

<sup>6</sup> Using  $B(\omega \rightarrow e^+e^-) = (7.07 \pm 0.19) \times 10^{-5}$  and using  $B(\eta \rightarrow 3\pi^0) = (32.24 \pm 0.29) \times 10^{-2}$ . Solution corresponding to constructive  $\omega$ - $\rho$  interference. The combined fit from 600 to 1380 MeV taking into account  $\rho(770)$ ,  $\omega(782)$ ,  $\phi(1020)$ , and  $\rho(1450)$  (mass and width fixed at 1450 MeV and 310 MeV respectively). Not independent of the corresponding  $\Gamma(e^+e^-) \times \Gamma(\eta\gamma)/\Gamma_{\text{total}}^2$ .

<sup>7</sup> Depending on the degree of coherence with the flat  $\eta\eta\gamma$  background and using  $B(\omega \rightarrow \pi^0\gamma) = (8.5 \pm 0.5) \times 10^{-2}$ .

<sup>8</sup> Reanalysis of DRUZHININ 84, DOLINSKY 89, DOLINSKY 91 taking into account the triangle anomaly contributions.

### PARAMETER $\Lambda$ IN $\omega \rightarrow \pi^0 \ell^+ \ell^-$ DECAY

NODE=M001230

In the pole approximation the electromagnetic transition form factor for a resonance of mass  $M$  is given by the expression:

$$|F|^2 = (1 - M^2/\Lambda^2)^{-2},$$

where for the parameter  $\Lambda$  vector dominance predicts  $\Lambda = M_p \approx 0.770$  GeV. The ARNALDI 09 measurement is in obvious conflict with this expectation. Note that for  $\eta \rightarrow \gamma \mu^+ \mu^-$  decay ARNALDI 09 and DZHELYADIN 80 obtain the value of  $\Lambda$  consistent with vector dominance.

### CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, 2 combinations of partial widths obtained from integrated cross section, and 19 branching ratios uses 51 measurements and one constraint to determine 9 parameters. The overall fit has a  $\chi^2 = 69.4$  for 43 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

NODE=M002223

This combination of a partial width with the partial width into  $\gamma\gamma$  and with the total width is obtained from the integrated cross section into channel(i) in the  $\gamma\gamma$  annihilation.

NODE=M002223

 $\Gamma(\gamma\gamma) \times \Gamma(\rho^0\gamma(\text{including non-resonant } \pi^+\pi^-\gamma))/\Gamma_{\text{total}}$  $\Gamma_7\Gamma_2/\Gamma$

 $\eta'(958) \rightarrow \eta\pi\pi$  DECAY PARAMETERS

NODE=M002225

$$|\text{MATRIX ELEMENT}|^2 = |1 + \alpha Y|^2 + CX + DX^2$$

$X$  and  $Y$  are Dalitz variables;  $\alpha$  is complex and  $C$ , and  $D$  are real-valued. Parameters  $C$  and  $D$  are not necessarily equal to  $c$  and  $d$ , respectively, in the generalized parameterization following this one. May be different for  $\eta'(958) \rightarrow \eta\pi^+\pi^-$  and  $\eta'(958) \rightarrow \eta\pi^0\pi^0$  decays. Because of different initial assumptions and strong correlations of the parameters we do not average the parameters in the section below.

NODE=M002225

 $\text{Re}(\alpha)$  decay parameter

 **$\eta'(958) \rightarrow \eta \pi \pi$  DECAY PARAMETERS**

$$|\text{MATRIX ELEMENT}|^2 \propto 1 + a Y + b Y^2 + c X + d X^2$$

X and Y are Dalitz variables and a, b, c, and d are real-valued parameters. May be different for  $\eta'(958) \rightarrow \eta \pi^+ \pi^-$  and  $\eta'(958) \rightarrow \eta \pi^0 \pi^0$  decays.

We do not average measurements in the section below because parameter values from each experiment are strongly correlated.

<sup>1</sup> T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ( $\pi\pi$ ), LONGACRE 86 ( $K\bar{K}$ ), BINON 83 ( $\eta\eta$ ), and BINON 84C ( $\eta\eta'$ ). Second solution  $977.8 \pm 0.6 \pm 1.6$  MeV.

<sup>2</sup> From the  $D^\pm \rightarrow K^\pm K^+ K^-$  Dalitz plot fit with the Triple-M amplitude in the multi-meson model of AOUDE 18.

<sup>3</sup> Pole position. Used Roy equations.

<sup>4</sup> Average of the analyses of three data sets in the K-matrix model. Uses the data of BATLEY 08A, HYAMS 73, and GRAYER 74, partially of COHEN 80 or ETKIN 82B.

<sup>5</sup> On sheet II in a 2-pole solution. The other pole is found on sheet III at (850–100i) MeV

<sup>6</sup> Using a relativistic Breit-Wigner function and taking into account the finite  $D_s$  mass.

<sup>7</sup> Breit-Wigner mass. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio  $g_{f_0 K K}/g_{f_0 \pi\pi} = 0$ .

<sup>8</sup> In the kaon-loop fit.

<sup>9</sup> In the no-structure fit.

<sup>10</sup> Systematic errors not estimated.

<sup>11</sup> FLATTE 76 parameterization.  $g_{f_0 \pi\pi} = 329 \pm 96$  MeV/c<sup>2</sup> assuming  $g_{f_0 K\bar{K}}/g_{f_0 \pi\pi} = 2$ .

- 12 Breit-Wigner mass. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio  $g_{f_0 K K} / g_{f_0 \pi \pi} = 4.21 \pm 0.25 \pm 0.21$  from ABLIKIM 05.
- 13 In the kaon-loop fit following formalism of ACHASOV 89.
- 14 In the no-structure fit assuming a direct coupling of  $\phi$  to  $f_0 \gamma$ .
- 15 FLATTE 76 parameterization. Supersedes GARMASH 05.
- 16 FLATTE 76 parameterization,  $g_{f_0 K \bar{K}} / g_{f_0 \pi \pi} = 4.21 \pm 0.25 \pm 0.21$ .
- 17 K-matrix pole from combined analysis of  $\pi^- p \rightarrow \pi^0 \pi^0 n$ ,  $\pi^- p \rightarrow K \bar{K} n$ ,  $\pi^+ \pi^- \rightarrow \pi^+ \pi^-$ ,  $\bar{p} p \rightarrow \pi^0 \pi^0 \pi^0$ ,  $\pi^0 \eta \eta$ ,  $\pi^0 \pi^0 \eta$ ,  $\pi^+ \pi^- \pi^0$ ,  $K^+ K^- \pi^0$ ,  $K_S^0 K_S^0 \pi^0$ ,  $K^+ K_S^0 \pi^-$  at rest,  $\bar{p} n \rightarrow \pi^- \pi^- \pi^+$ ,  $K_S^0 K^- \pi^0$ ,  $K_S^0 K_S^0 \pi^-$  at rest.
- 18 From the negative interference with the  $f_0(500)$  meson of AITALA 01B using the ACHASOV 89 parameterization for the  $f_0(980)$ , a Breit-Wigner for the  $f_0(500)$ , and ACHASOV 01F for the  $\rho\pi$  contribution.
- 19 Coupled-channel Breit-Wigner, couplings  $g_\pi = 0.09 \pm 0.01 \pm 0.01$ ,  $g_K = 0.02 \pm 0.04 \pm 0.03$ .
- 20 Supersedes ACHASOV 98i. Using the model of ACHASOV 89.
- 21 Supersedes ACHASOV 98i.
- 22 In the “narrow resonance” approximation.
- 23 Assuming  $\Gamma(f_0) = 40$  MeV.
- 24 From a narrow pole fit taking into account  $f_0(980)$  and  $f_0(1200)$  intermediate mechanisms.
- 25 From the combined fit of the photon spectra in the reactions  $e^+ e^- \rightarrow \pi^+ \pi^- \gamma$ ,  $\pi^0 \pi^0 \gamma$ .
- 26 Supersedes BARBERIS 99 and BARBERIS 99B.
- 27 T-matrix pole.
- 28 From invariant mass fit.
- 29 On sheet II in a 2 pole solution. The other pole is found on sheet III at  $(1039-93i)$  MeV.
- 30 On sheet II in a 2 pole solution. The other pole is found on sheet III at  $(963-29i)$  MeV.
- 31 Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.
- 32 At high  $|t|$ .
- 33 At low  $|t|$ .
- 34 On sheet II in a 4-pole solution, the other poles are found on sheet III at  $(953-55i)$  MeV and on sheet IV at  $(938-35i)$  MeV.
- 35 Combined fit of ALDE 95B, ANISOVICH 94, AMSLER 94D.
- 36 On sheet II in a 2 pole solution. The other pole is found on sheet III at  $(996-103i)$  MeV.
- 37 From sheet II pole position.
- 38 On sheet II in a 2 pole solution. The other pole is found on sheet III at  $(797-185i)$  MeV and can be interpreted as a shadow pole.
- 39 On sheet II in a 2 pole solution. The other pole is found on sheet III at  $(978-28i)$  MeV.
- 40 From coupled channel analysis.
- 41 Coupled channel analysis with finite width corrections.
- 42 Included in AGUILAR-BENITEZ 78 fit.

- <sup>1</sup> T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ( $\pi\pi$ ), LONGACRE 86 ( $K\bar{K}$ ), BINON 83 ( $\eta\eta$ ), and BINON 84C ( $\eta\eta'$ ). Second solution  $97.8 \pm 1.2 \pm 5.4$  MeV.
- <sup>2</sup> Pole position. Used Roy equations.
- <sup>3</sup> Average of the analyses of three data sets in the K-matrix model. Uses the data of BATLEY 08A, HYAMS 73, and GRAYER 74, partially of COHEN 80 or ETKIN 82B.
- <sup>4</sup> On sheet II in a 2-pole solution. The other pole is found on sheet III at (850–100*i*) MeV
- <sup>5</sup> Using a relativistic Breit-Wigner function and taking into account the finite  $D_S$  mass.
- <sup>6</sup> Breit-Wigner  $\pi\pi$  width. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio  $g_{f_0}^2 K K / g_{f_0}^2 \pi\pi = 0$ .
- <sup>7</sup> Systematic errors not estimated.
- <sup>8</sup> Breit-Wigner  $\pi\pi$  width. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio  $g_{f_0}^2 K K / g_{f_0}^2 \pi\pi = 4.21 \pm 0.25 \pm 0.21$  from ABLIKIM 05.
- <sup>9</sup> Breit-Wigner, solution 1, PWA ambiguous.
- <sup>10</sup> K-matrix pole from combined analysis of  $\pi^- p \rightarrow \pi^0 \pi^0 n$ ,  $\pi^- p \rightarrow K \bar{K} n$ ,  $\pi^+ \pi^- \rightarrow \pi^+ \pi^-$ ,  $\bar{p} p \rightarrow \pi^0 \pi^0 \pi^0$ ,  $\pi^0 \eta \eta$ ,  $\pi^0 \pi^0 \eta$ ,  $\pi^+ \pi^- \pi^0$ ,  $K^+ K^- \pi^0$ ,  $K_S^0 K_S^0 \pi^0$ ,  $K^+ K_S^0 \pi^-$  at rest,  $\bar{p} n \rightarrow \pi^- \pi^- \pi^+$ ,  $K_S^0 K^- \pi^0$ ,  $K_S^0 K_S^0 \pi^-$  at rest.
- <sup>11</sup> Using the data of AKHMETSHIN 99C, ACHASOV 00H, and ALOISIO 02D.
- <sup>12</sup> Breit-Wigner width.
- <sup>13</sup> Supersedes ACHASOV 98i. Using the model of ACHASOV 89.
- <sup>14</sup> Supersedes ACHASOV 98i.
- <sup>15</sup> In the “narrow resonance” approximation.
- <sup>16</sup> From the combined fit of the photon spectra in the reactions  $e^+ e^- \rightarrow \pi^+ \pi^- \gamma$ ,  $\pi^0 \pi^0 \gamma$ .
- <sup>17</sup> Supersedes BARBERIS 99 and BARBERIS 99B
- <sup>18</sup> T-matrix pole.
- <sup>19</sup> On sheet II in a 2 pole solution. The other pole is found on sheet III at (1039–93*i*) MeV.
- <sup>20</sup> From invariant mass fit.
- <sup>21</sup> On sheet II in a 2 pole solution. The other pole is found on sheet III at (963–29*i*) MeV.
- <sup>22</sup> Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.
- <sup>23</sup> At high  $|t|$ .
- <sup>24</sup> At low  $|t|$ .
- <sup>25</sup> On sheet II in a 4-pole solution, the other poles are found on sheet III at (953–55*i*) MeV and on sheet IV at (938–35*i*) MeV.
- <sup>26</sup> Combined fit of ALDE 95B, ANISOVICH 94,
- <sup>27</sup> On sheet II in a 2 pole solution. The other pole is found on sheet III at (996–103*i*) MeV.
- <sup>28</sup> From sheet II pole position.
- <sup>29</sup> On sheet II in a 2 pole solution. The other pole is found on sheet III at (797–185*i*) MeV and can be interpreted as a shadow pole.
- <sup>30</sup> On sheet II in a 2 pole solution. The other pole is found on sheet III at (978–28*i*) MeV.
- <sup>31</sup> From coupled channel analysis.
- <sup>32</sup> Coupled channel analysis with finite width corrections.
- <sup>33</sup> From coupled channel fit to the HYAMS 73 and PROTOPODESCU 73 data. With a simultaneous fit to the  $\pi\pi$  phase-shifts, inelasticity and to the  $K_S^0 K_S^0$  invariant mass.
- <sup>34</sup> Included in AGUILAR-BENITEZ 78 fit.

OCCUR=2

- <sup>1</sup> T-matrix pole with 2 poles, 2 channels, pole mass on adjacent sheet  $1002.4 \pm 1.4 \pm 6.6$  MeV.
- <sup>2</sup> Using the model of ACHASOV 89 and ACHASOV 03B.
- <sup>3</sup> From a fit with the S-wave amplitude including two interfering Breit-Wigners plus a background term.
- <sup>4</sup> Parameterizes couplings to  $\bar{K}K$ ,  $\pi\eta$ , and  $\pi\eta'$ .
- <sup>5</sup> Using AMSLER 94D and ABELE 98.
- <sup>6</sup> From the T-matrix pole on sheet II.
- <sup>7</sup> Using the model of ACHASOV 89. Supersedes ACHASOV 98B.
- <sup>8</sup> Using the model of JAFFE 77. Supersedes ACHASOV 98B.
- <sup>9</sup> T-matrix pole.
- <sup>10</sup> Breit-Wigner fit, average between  $a_0^\pm$  and  $a_0^0$ . The fit favors a slightly heavier  $a_0^\pm$ .
- <sup>11</sup> From a single Breit-Wigner fit.
- <sup>12</sup> From  $f_1(1285)$  decay.

NODE=M036R2

<sup>1</sup> Coupled channel analysis of  $\pi^+ \pi^- \pi^0$ ,  $K^+ K^- \pi^0$ , and  $K^\pm K_S^0 \pi^\mp$ .

<sup>2</sup> Using  $\pi^0 \pi^0 \eta$  from AMSLER 94D.

<sup>3</sup> From the decay of  $f_1(1285)$ .

<sup>4</sup> Residues from T-matrix pole with 2 poles, 2 channels. Solution on adjacent sheet  $0.149 \pm 0.001 \pm 0.039$ .

<sup>5</sup> This is a ratio of couplings.

<sup>6</sup> A ratio of couplings, using AMSLER 94D and ABELE 98. Supersedes BUGG 94.

OCCUR=2

- <sup>1</sup> Average of KOZYREV 16 and KOZYREV 18 values taking into account the correlated uncertainties. Supersedes individual KOZYREV 16 and KOZYREV 18 results.
- <sup>2</sup> Using a vector meson dominance model with contribution from  $\phi(1020)$  and higher mass excitations of  $\rho(770)$ ,  $\omega(782)$ , and  $\phi(1020)$ .
- <sup>3</sup> Using a phenomenological model based on KUHN 90 with a sum of Breit-Wigner resonances for  $\rho(770)$ ,  $\omega(782)$ ,  $\phi(1020)$  and their higher mass excitations.
- <sup>4</sup> Update of AKHMETSHIN 99D
- <sup>5</sup> From the combined fit assuming that the total  $\phi(1020)$  production cross section is saturated by those of  $K^+ K^-$ ,  $K_S K_L$ ,  $\pi^+ \pi^- \pi^0$ , and  $\eta \gamma$  decays modes and using ACHASOV 00B for the  $\eta \gamma$  decay mode.
- <sup>6</sup> Using a total width of  $4.43 \pm 0.05$  MeV. Systematic uncertainty included.
- <sup>7</sup> Using a total width of  $4.43 \pm 0.05$  MeV.
- <sup>8</sup> PELLINEN 82 review includes AKERLOF 77, DAUM 81, BALDI 77, AYRES 74, DE-GROOT 74.
- <sup>9</sup> Width fixed at 4.2 MeV.
- <sup>10</sup> The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization. Inclusion of vacuum polarization gives  $1019.457 \pm 0.020$  MeV.
- <sup>11</sup> From the  $D^\pm \rightarrow K^\pm K^+ K^-$  Dalitz plot fit with the Triple-M amplitude in the multi-meson model of AOUDE 18.
- <sup>12</sup> The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization.
- <sup>13</sup> Strongly correlated with AKHMETSHIN 04.
- <sup>14</sup> Systematic errors not evaluated.
- <sup>15</sup> Weighted and scaled average of 12 measurements of DIJKSTRA 86.
- <sup>16</sup> Mass errors enlarged by us to  $\Gamma/\sqrt{N}$ ; see the note with the  $K^*(892)$  mass.

NODE=M004W

OCCUR=2

- <sup>1</sup> Average of KOZYREV 16 and KOZYREV 18 values taking into account the correlated uncertainties. Supersedes individual KOZYREV 16 and KOZYREV 18 results.
- <sup>2</sup> Using a vector meson dominance model with contribution from  $\phi(1020)$  and higher mass excitations of  $\rho(770)$ ,  $\omega(782)$ , and  $\phi(1020)$ .
- <sup>3</sup> Using a phenomenological model based on KUHN 90 with a sum of Breit-Wigner resonances for  $\rho(770)$ ,  $\omega(782)$ ,  $\phi(1020)$  and their higher mass excitations.
- <sup>4</sup> Update of AKHMETSHIN 99D
- <sup>5</sup> From the combined fit assuming that the total  $\phi(1020)$  production cross section is saturated by those of  $K^+K^-$ ,  $K_S K_L$ ,  $\pi^+\pi^-\pi^0$ , and  $\eta\gamma$  decays modes and using ACHASOV 00B for the  $\eta\gamma$  decay mode.
- <sup>6</sup> Width errors enlarged by us to  $4\Gamma/\sqrt{N}$ ; see the note with the  $K^*(892)$  mass.
- <sup>7</sup> The values were extracted from a dispersively improved Breit-Wigner parameterization.
- <sup>8</sup> The values were extracted from a dispersively improved Breit-Wigner parameterization and do not include vacuum polarization.
- <sup>9</sup> Strongly correlated with AKHMETSHIN 04.
- <sup>10</sup> Systematic errors not evaluated.

## CONSTRAINED FIT INFORMATION

An overall fit to 30 branching ratios uses 81 measurements and one constraint to determine 14 parameters. The overall fit has a  $\chi^2 = 63.1$  for 68 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

<sup>1</sup> From a combined fit of  $\sigma(e^+ e^- \rightarrow \eta\gamma)$  with  $\eta \rightarrow 3\pi^0$  and  $\eta \rightarrow \pi^+ \pi^- \pi^0$ , and fixing  $B(\eta \rightarrow 3\pi^0) / B(\eta \rightarrow \pi^+ \pi^- \pi^0) = 1.44 \pm 0.04$ . Recalculated by us from the cross section at the peak. Supersedes ACHASOV 00D and ACHASOV 06A.

<sup>2</sup> From the  $\eta \rightarrow 2\gamma$  decay and using  $B(\eta \rightarrow \gamma\gamma) = 39.43 \pm 0.26\%$ .

<sup>3</sup> From the  $\eta \rightarrow 3\pi^0$  decay and using  $B(\eta \rightarrow 3\pi^0) = (32.24 \pm 0.29) \times 10^{-2}$ .

<sup>4</sup> The combined fit from 600 to 1380 MeV taking into account  $\rho(770)$ ,  $\omega(782)$ ,  $\phi(1020)$ , and  $\rho(1450)$  (mass and width fixed at 1450 MeV and 310 MeV respectively).

<sup>5</sup> From the  $\eta \rightarrow 2\gamma$  decay and using  $B(\eta \rightarrow 2\gamma) = (39.21 \pm 0.34) \times 10^{-2}$ .

<sup>6</sup> Recalculated by the authors from the cross section in the peak.

<sup>7</sup> From the  $\eta \rightarrow \pi^+ \pi^- \pi^0$  decay and using  $B(\eta \rightarrow \pi^+ \pi^- \pi^0) = (23.1 \pm 0.5) \times 10^{-2}$ .

<sup>8</sup> A simultaneous fit of  $e^+ e^- \rightarrow \pi^+ \pi^-, \pi^+ \pi^- \pi^0, \pi^0 \gamma, \eta\gamma$  data.

<sup>1</sup> The prediction taking into account phase-space difference, radiative corrections, isospin breaking, and the Sommerfeld-Gamow-Sakharov factor gives 0.630.

<sup>2</sup> Theoretical analysis of BRAMON 00 taking into account phase-space difference, electromagnetic radiative corrections, as well as isospin breaking, predicts 0.62. FLOREZ-BAEZ 08 predicts 0.63 considering also structure-dependent radiative corrections. FIS-CHBACH 02 calculates additional corrections caused by the close threshold and predicts 0.68. See also BENAYOUN 01 and DUBYSKIY 07. BENAYOUN 12 obtains  $0.71 \pm 0.01$  in the HLS model.

OCCUR=2

<sup>1</sup> Using  $B(\phi \rightarrow e^+e^-) = (2.99 \pm 0.08) \times 10^{-4}$  and  $B(\eta \rightarrow 3\pi^0) = (32.2 \pm 0.4) \times 10^{-2}$ .

<sup>2</sup> From  $\pi^+\pi^-\pi^0$  decay mode of  $\eta$ .

<sup>3</sup> From  $2\gamma$  decay mode of  $\eta$ .

<sup>4</sup> From  $3\pi^0$  decay mode of  $\eta$ .

<sup>5</sup> Combined analysis of the CMD-2 data on  $\phi \rightarrow K^+K^-, K_S^0 K_L^0, \pi^+\pi^-\pi^0, \eta\gamma$  assuming that the sum of their branching fractions is  $0.99741 \pm 0.00007$ .

<sup>6</sup> ACHASOV 07B reports  $[\Gamma(\phi(1020) \rightarrow \eta\gamma)/\Gamma_{\text{total}}] \times [B(\phi(1020) \rightarrow e^+e^-)] = (4.050 \pm 0.067 \pm 0.118) \times 10^{-6}$  which we divide by our best value  $B(\phi(1020) \rightarrow e^+e^-) = (2.974 \pm 0.034) \times 10^{-4}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. Supersedes ACHASOV 00D and ACHASOV 06A.

<sup>7</sup> Using  $B(\phi \rightarrow e^+e^-) = (2.98 \pm 0.04) \times 10^{-4}$  and  $B(\eta \rightarrow \gamma\gamma) = 39.43 \pm 0.26\%$ .

<sup>8</sup> Not independent of the corresponding  $\Gamma(e^+e^-) \times \Gamma(\eta\gamma)/\Gamma_{\text{total}}^2$ .

<sup>9</sup> Using  $B(\phi \rightarrow e^+e^-) = (2.99 \pm 0.08) \times 10^{-4}$  and  $B(\eta \rightarrow 3\pi^0) = (32.24 \pm 0.29) \times 10^{-2}$ .

<sup>10</sup> The combined fit from 600 to 1380 MeV taking into account  $\rho(770), \omega(782), \phi(1020)$ , and  $\rho(1450)$  (mass and width fixed at 1450 MeV and 310 MeV respectively).

<sup>11</sup> From the  $\eta \rightarrow 2\gamma$  decay and using  $B(\phi \rightarrow e^+e^-) = (2.99 \pm 0.08) \times 10^{-4}$ .

<sup>12</sup> From  $\pi^+\pi^-\pi^0$  decay mode of  $\eta$  and using  $B(\phi \rightarrow e^+e^-) = (2.99 \pm 0.08) \times 10^{-4}$ .

<sup>13</sup> Reanalysis of DRUZHININ 84, DOLINSKY 89, and DOLINSKY 91 taking into account a triangle anomaly contribution.

<sup>1</sup> From the combined fit assuming that the total  $\phi(1020)$  production cross section is saturated by those of  $K^+K^-$ ,  $K_S^0 K_L^0$ ,  $\pi^+\pi^-\pi^0$ , and  $\eta\gamma$  decays modes and using ACHASOV 00B for the  $\eta\gamma$  decay mode.

<sup>2</sup> Using total width 4.2 MeV. They detect  $3\pi$  mode and observe significant interference with  $\omega$  tail. This is accounted for in the result quoted above.

OCCUR=2

OCCUR=2

<sup>1</sup> Obtained by the authors taking into account the  $\pi^+\pi^-$  decay mode. Includes a component due to  $\pi\pi$  production via the  $f_0(500)$  meson. Supersedes ALOISIO 02D.

<sup>2</sup> From the combined fit of the photon spectra in the reactions  $e^+e^- \rightarrow \pi^+\pi^-\gamma$ ,  $\pi^0\pi^0\gamma$ .

<sup>3</sup> From the negative interference with the  $f_0(500)$  meson of AITALA 01B using the ACHASOV 89 parameterization for the  $f_0(980)$ , a Breit-Wigner for the  $f_0(500)$ , and ACHASOV 01F for the  $\rho\pi$  contribution. Superseded by AMBROSINO 07.

<sup>4</sup> Assuming that the  $\pi^0\pi^0\gamma$  final state is completely determined by the  $f_0\gamma$  mechanism, neglecting the decay  $B(\phi \rightarrow K\bar{K}\gamma)$  and using  $B(f_0 \rightarrow \pi^+\pi^-) = 2B(f_0 \rightarrow \pi^0\pi^0)$ .

<sup>5</sup> Using the value  $B(\phi \rightarrow \eta\gamma) = (1.338 \pm 0.053) \times 10^{-2}$ .

<sup>6</sup> For  $E_\gamma > 20$  MeV. Supersedes AKHMETSHIN 97C.

<sup>7</sup> Neglecting other intermediate mechanisms ( $\rho\pi$ ,  $\sigma\gamma$ ).

<sup>8</sup> A narrow pole fit taking into account  $f_0(980)$  and  $f_0(1200)$  intermediate mechanisms.

<sup>9</sup> For destructive interference with the Bremsstrahlung process

<sup>10</sup> For constructive interference with the Bremsstrahlung process

## PARAMETER $\beta$ IN $\phi \rightarrow Pe^+e^-$ DECAYS

In the one-pole approximation the electromagnetic transition form factor for  $\phi \rightarrow Pe^+e^-$  ( $P = \pi, \eta$ ) is given as a function of the  $e^+e^-$  invariant mass squared,  $q^2$ , by the expression:

$$|F(q^2)|^2 = (1 - q^2/\Lambda^2)^{-2},$$

where vector meson dominance predicts parameter  $\Lambda \approx 0.770$  GeV ( $\Lambda^{-2} \approx 1.687$  GeV $^{-2}$ ). The slope of this form factor,  $\beta = dF/dq^2(q^2=0)$ , equals  $\Lambda^{-2}$  in this approximation.

The measurements below obtain  $\beta$  in the one-pole approximation.

<sup>1</sup> Statistical error negligible.

<sup>2</sup> From the pole position. Using an amplitude analysis based on approximate three-body unitarity of  $\tau$  data from SCHAEEL 05C.

<sup>3</sup> Superseded by AGHASYAN 2018B.

<sup>4</sup> The  $\rho^\pm \pi^\mp$  state can be also due to the  $\pi(1300)$ .

<sup>5</sup> Using the Breit-Wigner parameterization; strong correlation between mass and width.

<sup>6</sup> Using the data of BARATE 98R.

<sup>7</sup> From a fit of the  $K^- K^{*0}$  distribution assuming  $m_{a_1} = 1230$  MeV and purely resonant production of the  $K^- K^{*0}$  system.

<sup>8</sup> From a fit to the  $3\pi$  mass spectrum including the  $K\bar{K}^*(892)$  threshold.

<sup>9</sup> Using the  $a_1(1260)$  mass of 1230 MeV.

<sup>10</sup> From AKHMETSHIN 99E and ASNER 00 data using the  $a_1(1260)$  mass of 1230 MeV.

<sup>11</sup> Uses the model of KUHN 90.

<sup>12</sup> Uses the model of ISGUR 89.

<sup>13</sup> Includes the effect of a possible  $a'_1$  state.

<sup>14</sup> Uses the model of FEINDT 90.

<sup>15</sup> Supersedes AKERS 95P.

<sup>16</sup> Average and spread of values using 2 variants of the model of BOWLER 75.

<sup>17</sup> Reanalysis of RUCKSTUHL 86.

<sup>18</sup> Reanalysis of SCHMIDKE 86.

<sup>19</sup> Reanalysis of ALBRECHT 86B.

<sup>20</sup> From a combined reanalysis of ALBRECHT 86B, SCHMIDKE 86, and RUCKSTUHL 86.

<sup>21</sup> From a combined reanalysis of ALBRECHT 86B and DAUM 81B.

<sup>22</sup> Uses the model of BOWLER 75.

<sup>23</sup> Produced in  $K^-$  backward scattering.

NODE=M010R13  
NODE=M010R13

- <sup>1</sup> From a fit to the Dalitz plot.
- <sup>2</sup> Assuming for  $\rho(1450)$  mass and width of 1370 and 386 MeV respectively.
- <sup>3</sup> Assuming for  $f_0(500)$  ( $\sigma$ ) mass and width of 860 and 880 MeV respectively.
- <sup>4</sup> Uses multichannel Aitchison-Bowler model (BOWLER 75). Uses data from GAVIL-LET 77, DAUM 80, and DANKOWYCH 81.
- <sup>5</sup> Assuming for  $f_0(1370)$  mass and width of 1186 and 350 MeV respectively.
- <sup>6</sup> Assuming for  $f_2(1270)$  mass and width of 1275 and 185 MeV respectively.
- <sup>7</sup> Inconsistent with observations of  $\sigma\pi$ ,  $f_0(1370)\pi$ , and  $f_2(1270)\pi$  decay modes.
- <sup>8</sup> Using structure functions from KUHN 92 and DECKER 93A and  $B(\tau^- \rightarrow K^- \pi^- K^+ \nu_\tau) = (0.155 \pm 0.006 \pm 0.009)\%$  from BRIERE 03.
- <sup>9</sup> From a comparison to ALAM 94 assuming purely resonant production of the  $K^- K^{*0}$  system.
- <sup>10</sup> From a fit to the  $3\pi$  mass spectrum including the  $K\bar{K}^*(892)$  threshold.
- <sup>11</sup> Assuming  $a_1(1260)$  dominance and taking  $B(\tau^- \rightarrow a_1(1260)\nu_\tau)$  from BUSKULIC 96.

### CONSTRAINED FIT INFORMATION

An overall fit to the total width, 4 partial widths, a combination of partial widths obtained from integrated cross sections, and 6 branching ratios uses 45 measurements and one constraint to determine 8 parameters. The overall fit has a  $\chi^2 = 83.0$  for 38 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$\Gamma(\gamma\gamma)$  $\Gamma_7$ 

The value of this width depends on the theoretical model used. Unitary approaches with scalars typically (with exception of PENNINGTON 08) give values clustering around 2.6 keV; without an  $S$ -wave contribution, values are systematically higher (typically around 3 keV).

<sup>1</sup> Based on a  $K$ -matrix analysis of BELLE data from MORI 07, UEHARA 08A, UEHARA 09 and UEHARA 13. The width is derived for the pole on the third sheet which is closest to the physical axis. Supersedes PENNINGTON 08.

<sup>2</sup> Solution A (preferred solution based on  $\chi^2$ -analysis).

<sup>3</sup> Dispersion theory based amplitude analysis of BOYER 90, MARSISKE 90, BEHREND 92, and MORI 07.

<sup>4</sup> Solution B (worse than solution A; still acceptable when systematic uncertainties are included).

<sup>5</sup> From analysis of L3 data at 91 and 183–209 GeV and using SU(3) relations.

<sup>6</sup> With a narrow scalar state around 1220 MeV.

<sup>7</sup> Using a unitarized model with a 300 - 500 keV wide scalar at 1100 MeV.

<sup>8</sup> Using the unitarized model of LYTH 85.

<sup>9</sup> Error includes spread of different solutions. Data of MARK2 and CRYSTAL BALL used in the analysis. Authors report strong correlations with  $\gamma\gamma$  width of  $f_0(1370)$ :  $\Gamma(f_2) + 1/4 \Gamma(f_0) = 3.6 \pm 0.3$  KeV.

<sup>10</sup> Radiative corrections modify the partial widths; for instance the COURAU 84 value becomes  $2.66 \pm 0.21$  in the calculation of LANDRO 86.

<sup>11</sup> Using the MENNESSIER 83 model.

<sup>12</sup> Superseded by BOYER 90.

<sup>13</sup> If helicity = 2 assumption is not made.

<sup>14</sup> Using mass, width and  $B(f_2(1270) \rightarrow 2\pi)$  from PDG 78.

 $\Gamma(e^+e^-)$  $\Gamma_{10}$

$\Gamma(K\bar{K})/\Gamma(\pi\pi)$  $\Gamma_3/\Gamma_1$ 

We average only experiments which either take into account  $f_2(1270)$ - $a_2(1320)$  interference explicitly or demonstrate that  $a_2(1320)$  production is negligible.

**CONSTRAINED FIT INFORMATION**

An overall fit to 6 branching ratios uses 18 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 24.0$  for 14 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

<sup>1</sup> The systematic error of 2 MeV corresponds to the spread of solutions.<sup>2</sup> Error includes 5 MeV systematic mass-scale error.<sup>3</sup> T-matrix pole with 2 poles, 2 channels ( $\pi^0 \eta$  and  $K\bar{K}$ ).<sup>4</sup> The coupled-channel analysis of both the  $\eta\pi$  and  $\eta'\pi$  systems using ADOLPH 15 data. The mass is extracted from the T-matrix pole.<sup>5</sup> Superseded by RODAS 19.<sup>6</sup> ADOLPH 15 value is derived from a Breit-Wigner fit with mass-dependent width taking the  $\eta\pi$  and  $\rho\pi$  channels into account.<sup>7</sup> Missing mass with enriched MMS =  $\eta\pi^-$ ,  $\eta = 2\gamma$ . **$\eta'\pi$  MODE**

<sup>1</sup> The systematic error of 2 MeV corresponds to the spread of solutions.

<sup>2</sup> T-matrix pole with 2 poles, 2 channels ( $\pi^0 \eta$  and  $K\bar{K}$ ).

<sup>3</sup> The coupled-channel analysis of both the  $\eta\pi$  and  $\eta'\pi$  systems using ADOLPH 15 data. The width is extracted from the T-matrix pole.

<sup>4</sup> Superseded by RODAS 19.

<sup>5</sup> ADOLPH 15 value is derived from a Breit-Wigner fit with mass-dependent width taking the  $\eta\pi$  and  $\rho\pi$  channels into account.

<sup>6</sup> Resolution is not unfolded.

<sup>7</sup> Missing mass with enriched MMS =  $\eta\pi^-$ ,  $\eta = 2\gamma$ .

## CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 18 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 9.3$  for 15 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

OCCUR=2

<sup>1</sup>KARSHON 74 suggest an additional  $I = 0$  state strongly coupled to  $\omega\pi\pi$  which could explain discrepancies in branching ratios and masses. We use a central value and a systematic spread.

<sup>2</sup>Decays to  $b_1(1040)\pi$ ,  $b_1 \rightarrow \omega\pi$ . Error increased to account for possible systematic errors of complicated analysis.

<sup>1</sup> T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ( $\pi\pi$ ), LONGACRE 86 ( $K\bar{K}$ ), BINON 83 ( $\eta\eta$ ), and BINON 84c ( $\eta\eta'$ ).

<sup>2</sup> Another pole is found at  $(1510 \pm 130) - i(800^{+100}_{-150})$  MeV.

<sup>3</sup> Coupled channel analysis of  $\pi^+ \pi^- \pi^0, K^+ K^- \pi^0$ , and  $K^\pm K_S^0 \pi^\mp$ .

<sup>4</sup> Average between  $\pi^+ \pi^- 2\pi^0$  and  $2(\pi^+ \pi^-)$ .

<sup>5</sup> T-matrix pole on sheet — — —.

<sup>6</sup> Supersedes ANISOVICH 94.

<sup>7</sup> Coupled-channel analysis of  $\bar{p}p \rightarrow 3\pi^0, \pi^0 \eta \eta$ , and  $\pi^0 \pi^0 \eta$  on sheet IV. Demonstrates explicitly that  $f_0(500)$  and  $f_0(1370)$  are two different poles.

<sup>8</sup> Analysis of data from FALVARD 88.

<sup>9</sup> The pole is on Sheet III. Demonstrates explicitly that  $f_0(500)$  and  $f_0(1370)$  are two different poles.

<sup>10</sup> Uses data from BEIER 72B, OCHS 73, HYAMS 73, GRAYER 74, ROSSELET 77, CASON 83, ASTON 88, and ARMSTRONG 91B. Coupled channel analysis with flavor symmetry and all light two-pseudoscalars systems.

<sup>11</sup> Reanalysis of ANISOVICH 94 data.

<sup>12</sup> T-matrix pole on sheet III.

<sup>13</sup> Analysis of data from OCHS 73, GRAYER 74, BECKER 79, and CASON 83.

<sup>9</sup> From a fit with a width fixed at 55 MeV.

<sup>10</sup> The form factor parameter from the fit is  $926 \pm 78$  MeV.

<sup>11</sup> Assume a  $\rho$ -pole form factor.

<sup>12</sup> A  $\phi$ -pole form factor gives considerably smaller widths.

<sup>13</sup> Published value divided by 2.

OCCUR=2

OCCUR=3

- <sup>1</sup> From a fit of the interfering  $\omega(1420)$  and  $\omega(1650)$  with a relative phase of  $\pi$  and other parameters floating.
- <sup>2</sup> From a fit with contributions from  $\omega(782)$ ,  $\phi(1020)$ ,  $\omega(1420)$ , and  $\omega(1650)$ . See ACHASOV 20A for a further analysis of the  $\pi^+\pi^-\pi^0$  data.
- <sup>3</sup> From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the  $\pi^+\pi^-\pi^0$  and ANTONELLI 92 on the  $\omega\pi^+\pi^-$  final states. Supersedes ACHASOV 99E and ACHASOV 02E.
- <sup>4</sup> Using results of CORDIER 81 and preliminary data of DOLINSKY 91 and ANTONELLI 92.
- <sup>5</sup> Using the data of AKHMETSHIN 00D and ANTONELLI 92. The  $\rho\pi$  dominance for the energy dependence of the  $\omega(1420)$  and  $\omega(1650)$  width assumed.
- <sup>6</sup> Using data from BARKOV 87, DOLINSKY 91, and ANTONELLI 92.
- <sup>7</sup> Using the data from ANTONELLI 92.
- <sup>8</sup> Using the data from IVANOV 81 and BISELLO 88B.
- <sup>9</sup> From a fit to two Breit-Wigner functions and using the data of DOLINSKY 91 and ANTONELLI 92.
- <sup>10</sup> From a fit to two Breit-Wigner functions interfering between them and with the  $\omega, \phi$  tails with fixed (+, -, +) phases.

- <sup>1</sup> From a fit with contributions from  $\omega(1420)$ ,  $\omega(1650)$ , and  $\phi(1680)$ . The mass of  $\omega(1420)$  is fixed to the PDG 18 value of 1420 MeV.
- <sup>2</sup> From a fit of the interfering  $\omega(1420)$  and  $\omega(1650)$  with a relative phase of  $\pi$  and other parameters floating.
- <sup>3</sup> From a fit with contributions from  $\omega(782)$ ,  $\phi(1020)$ ,  $\omega(1420)$ , and  $\omega(1650)$ . See ACHASOV 20A for a further analysis of the  $\pi^+\pi^-\pi^0$  data.
- <sup>4</sup> From a fit of a VMD model with two effective resonances with masses of 1450 MeV and 1700 MeV to describe the excited vector states  $\omega(1420)$ ,  $\rho(1450)$ ,  $\omega(1650)$ , and  $\rho(1700)$ . Systematic errors not evaluated.
- <sup>5</sup> From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the  $\pi^+\pi^-\pi^0$  and ANTONELLI 92 on the  $\omega\pi^+\pi^-$  final states. Supersedes ACHASOV 99E and ACHASOV 02E.
- <sup>6</sup> Using results of CORDIER 81 and preliminary data of DOLINSKY 91 and ANTONELLI 92.
- <sup>7</sup> Using the data of AKHMETSHIN 00D and ANTONELLI 92. The  $\rho\pi$  dominance for the energy dependence of the  $\omega(1420)$  and  $\omega(1650)$  width assumed.
- <sup>8</sup> From a fit to two Breit-Wigner functions and using the data of DOLINSKY 91 and ANTONELLI 92.
- <sup>9</sup> From a fit to two Breit-Wigner functions interfering between them and with the  $\omega, \phi$  tails with fixed (+, -, +) phases.

**$f_2(1430)$**

$I^G(J^{PC}) = 0^+(2^{++})$

OMITTED FROM SUMMARY TABLE

This entry lists nearby peaks observed in the  $D$  wave of the  $K\bar{K}$  and  $\pi^+\pi^-$  systems. Needs confirmation.

**THE  $\rho(1450)$  AND THE  $\rho(1700)$** 

Updated September 2019 by S. Eidelman (Novosibirsk), C. Hanhart (Juelich) and G. Venanzoni (Pisa).

In our 1988 edition, we replaced the  $\rho(1600)$  entry with two new ones, the  $\rho(1450)$  and the  $\rho(1700)$ , because there was emerging evidence that the 1600-MeV region actually contains two  $\rho$ -like resonances. Erkal [1] had pointed out this possibility with a theoretical analysis on the consistency of  $2\pi$  and  $4\pi$  electromagnetic form factors and the  $\pi\pi$  scattering length. Donnachie [2], with a full analysis of data on the  $2\pi$  and  $4\pi$  final states in  $e^+e^-$  annihilation and photoproduction reactions, had also argued that in order to obtain a consistent picture, two resonances were necessary. The existence of  $\rho(1450)$  was supported by the analysis of  $\eta\rho^0$  mass spectra obtained in photoproduction and  $e^+e^-$  annihilation [3], as well as that of  $e^+e^- \rightarrow \omega\pi$  [4].

The analysis of [2] was further extended by [5,6] to include new data on  $4\pi$ -systems produced in  $e^+e^-$  annihilation, and in  $\tau$ -decays ( $\tau$  decays to  $4\pi$ , and  $e^+e^-$  annihilation to  $4\pi$  can be related by the Conserved Vector Current assumption). These systems were successfully analyzed using interfering contributions from two  $\rho$ -like states, and from the tail of the  $\rho(770)$  decaying into two-body states. While specific conclusions on

$\rho(1450) \rightarrow 4\pi$  were obtained, little could be said about the  $\rho(1700)$ .

Independent evidence for two  $1^-$  states is provided by [7] in  $4\pi$  electroproduction at  $\langle Q^2 \rangle = 1$  (GeV/c)<sup>2</sup>, and by [8] in a high-statistics sample of the  $\eta\pi\pi$  system in  $\pi^-p$  charge exchange.

This scenario with two overlapping resonances is supported by other data. Bisello [9] measured the pion form factor in the interval 1.35–2.4 GeV, and observed a deep minimum around 1.6 GeV. The best fit was obtained with the hypothesis of  $\rho$ -like resonances at 1420 and 1770 MeV, with widths of about 250 MeV. Antonelli [10] found that the  $e^+e^- \rightarrow \eta\pi^+\pi^-$  cross section is better fitted with two fully interfering Breit-Wigners, with parameters in fair agreement with those of [2] and [9]. These results can be considered as a confirmation of the  $\rho(1450)$ .

Decisive evidence for the  $\pi\pi$  decay mode of both  $\rho(1450)$  and  $\rho(1700)$  comes from  $\bar{p}p$  annihilation at rest [11]. It has been shown that these resonances also possess a  $K\bar{K}$  decay mode [12–14]. High-statistics studies of the decays  $\tau \rightarrow \pi\pi\nu_\tau$  [15,16], and  $\tau \rightarrow 4\pi\nu_\tau$  [17] also require the  $\rho(1450)$ , but are not sensitive to the  $\rho(1700)$ , because it is too close to the  $\tau$  mass. A recent very-high-statistics study of the  $\tau \rightarrow \pi\pi\nu_\tau$  decay performed at Belle [18] reports the first observation of both  $\rho(1450)$  and  $\rho(1700)$  in  $\tau$  decays. A clear picture of the two  $\pi^+\pi^-$  resonances interfering with the  $\rho(770)$  in  $e^+e^-$  annihilation was also reported by BaBar using the ISR method [19].

The structure of these  $\rho$  states is not yet completely clear. Barnes [20] and Close [21] claim that  $\rho(1450)$  has a mass consistent with radial  $2S$ , but its decays show characteristics of hybrids, and suggest that this state may be a  $2S$ -hybrid mixture. Donnachie [22] argues that hybrid states could have a  $4\pi$  decay mode dominated by the  $a_1\pi$ . Such behavior has been observed by [23] in  $e^+e^- \rightarrow 4\pi$  in the energy range 1.05–1.38 GeV, and by [17] in  $\tau \rightarrow 4\pi$  decays. CLEO [24] and Belle [25] observe the  $\rho(1450) \rightarrow \omega\pi$  decay mode in  $B$ -meson decays, however, do not find  $\rho(1700) \rightarrow \omega\pi^0$ . A similar conclusion is made by [26,27], who studied the process  $e^+e^- \rightarrow \omega\pi^0$  and do not observe a statistically significant signal of the  $\rho(1700)$ . Various decay modes of the  $\rho(1450)$  and  $\rho(1700)$  are observed in  $\bar{p}n$  and  $\bar{p}p$  annihilation [28,29], but no definite conclusions can be drawn. More data should be collected to clarify the nature of the  $\rho$  states, particularly in the energy range above 1.6 GeV.

We now list under a separate entry the  $\rho(1570)$ , the  $\phi\pi$  state with  $J^{PC} = 1^{--}$  earlier observed by [30] (referred to as  $C(1480)$ ) and recently confirmed by [31]. While [32] shows that it may be a threshold effect, [5] and [33] suggest two independent vector states with this decay mode. The  $C(1480)$  has not been seen in the  $\bar{p}p$  [34] and  $e^+e^-$  [35,36] experiments. However, the sensitivity of the two latter is an order of magnitude lower than that of [31]. Note that [31] can not exclude that their observation is due to an OZI-suppressed decay mode of the  $\rho(1700)$ .

Several observations on the  $\omega\pi$  system in the 1200-MeV region [37–43] may be interpreted in terms of either  $J^P = 1^-$   $\rho(770) \rightarrow \omega\pi$  production [44], or  $J^P = 1^+$   $b_1(1235)$  production [42,43]. We argue that no special entry for a  $\rho(1250)$  is needed. The LASS amplitude analysis [45] showing evidence for  $\rho(1270)$  is preliminary and needs confirmation. For completeness, the relevant observations are listed under the  $\rho(1450)$ .

Recently [46] reported a very broad  $1^{--}$  resonance-like  $K^+K^-$  state in  $J/\psi \rightarrow K^+K^-\pi^0$  decays. Its pole position corresponds to mass of 1576 MeV and width of 818 MeV. [47–49] suggest its exotic structure (molecular or multiquark), while [50] and [51] explain it by the interference between the  $\rho(1450)$  and  $\rho(1700)$ . The latter statement is qualitatively supported by BaBar [52] and SND [53]. We quote [46] as  $X(1575)$  in the section “Further States.”

Evidence for  $\rho$ -like mesons decaying into  $6\pi$  states was first noted by [54] in the analysis of  $6\pi$  mass spectra from  $e^+e^-$  annihilation [55,56] and diffractive photoproduction [57]. Clegg [54] argued that two states at about 2.1 and 1.8 GeV exist: while the former is a candidate for the  $\rho(2150)$ , the latter could be a manifestation of the  $\rho(1700)$  distorted by threshold effects. BaBar reported observations of the new decay modes of the  $\rho(2150)$  in the channels  $\eta'(958)\pi^+\pi^-$  and  $f_1(1285)\pi^+\pi^-$  [58]. The relativistic quark model [59] predicts the  $2^3D_1$  state with  $J^{PC} = 1^{--}$  at 2.15 GeV which can be identified with the  $\rho(2150)$ .

We no longer list under a separate particle  $\rho(1900)$  various observations of irregular behavior of the cross sections near the  $N\bar{N}$  threshold. Dips of various width around 1.9 GeV were reported by the E687 Collaboration (a narrow one in the  $3\pi^+3\pi^-$  diffractive photoproduction [60,61]), by the FENICE experiment (a narrow structure in the  $R$  value [62])

, by BaBar in ISR (a narrow structure in  $e^+e^- \rightarrow \phi\pi$  final state [63], but much broader in  $e^+e^- \rightarrow 3\pi^+3\pi^-$  and  $e^+e^- \rightarrow 2(\pi^+\pi^-\pi^0)$  [64]) , by CMD-3 (also a rather broad dip in  $e^+e^- \rightarrow 3\pi^+3\pi^-$  [65]) . A dedicated scan of the  $N\bar{N}$ -threshold region by CMD-3 confirms this effect in the  $e^+e^- \rightarrow 3\pi^+3\pi^-$  and  $e^+e^- \rightarrow K^+K^-\pi^+\pi^-$  final states, but does not see it in the cross section of  $e^+e^- \rightarrow 2\pi^+2\pi^-$  [66]. Most probably, these structures emerge as a threshold effect due to the opening of the  $N\bar{N}$  channel [67,68,69].

<sup>1</sup> Mass and width of the  $\rho(770)$  fixed at 775 and 149 MeV, respectively; solution 2 of model 2,  $\eta \rightarrow \gamma\gamma$  decays used.

<sup>2</sup> From the combined fit of AULCHENKO 15 and ACHASOV 18 in the model with the interfering  $\rho(1450)$ ,  $\rho(1700)$  and  $\rho(2150)$  with the parameters of the  $\rho(1450)$  and  $\rho(1700)$  floating and the mass and width of the  $\rho(2150)$  fixed at 2155 MeV and 320 MeV, respectively. The phases of the resonances are  $\pi$ , 0 and  $\pi$ , respectively.

<sup>3</sup> Using the data of AKHMETSHIN 01B on  $e^+e^- \rightarrow \eta\gamma$ , AKHMETSHIN 00D and ANTONELLI 88 on  $e^+e^- \rightarrow \eta\pi^+\pi^-$ .

<sup>4</sup> Using the data of ANTONELLI 88, DOLINSKY 91, and AKHMETSHIN 00D. The energy-independent width of the  $\rho(1450)$  and  $\rho(1700)$  mesons assumed.

<sup>1</sup> From a phenomenological model based on vector meson dominance with interfering  $\rho(770)$ ,  $\rho(1450)$ , and  $\rho(1700)$ . The  $\rho(1700)$  mass and width are fixed at 1720 MeV and 250 MeV, respectively. Systematic uncertainties not estimated. Supersedes ACHASOV 13.

<sup>2</sup> Using Breit-Wigner parameterization of the  $\rho(1450)$  and assuming equal probabilities of the  $\rho(1450) \rightarrow \pi\pi$  and  $\rho(1450) \rightarrow \omega\pi$  decays.

<sup>3</sup> From a phenomenological model based on vector meson dominance with the interfering  $\rho(1450)$  and  $\rho(1700)$  and their widths fixed at 400 and 250 MeV, respectively. Systematic uncertainty not estimated.

<sup>4</sup> Using the data of AKHMETSHIN 03B and BISELLO 91B assuming the  $\omega\pi^0$  and  $\pi^+\pi^-$  mass dependence of the total width.  $\rho(1700)$  mass and width fixed at 1700 MeV and 240 MeV, respectively.

<sup>5</sup> Using Breit-Wigner parameterization of the  $\rho(1450)$  and assuming the  $\omega\pi^-$  mass dependence for the total width.

<sup>6</sup> Mass-independent width parameterization.  $\rho(1700)$  mass and width fixed at 1700 MeV and 235 MeV respectively.

<sup>7</sup> Using data from BISELLO 91B, DOLINSKY 86 and ALBRECHT 87L.

<sup>8</sup> Not separated from  $b_1(1235)$ , not pure  $J^P = 1^-$  effect.

<sup>1</sup> Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of LEES 12G and ABLIKIM 16C.

<sup>2</sup> Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of ACHASOV 06, AKHMETSHIN 07, AUBERT 09AS, and AMBROSINO 11A.

<sup>3</sup> Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of FUJIKAWA 08.

<sup>4</sup> From a Dalitz plot analysis in an isobar model with  $\rho(1450)$  and  $\rho(1700)$  masses and widths floating.

<sup>5</sup> Using the KUHN 90 parametrization of the pion form factor, neglecting  $\rho-\omega$  interference.

<sup>6</sup> Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the  $\rho(1450)$ ,  $\rho(1700)$ , and  $\rho(2150)$  resonances as free parameters of the fit.

<sup>7</sup> From the GOUNARIS 68 parametrization of the pion form factor.

<sup>8</sup>  $|F_\pi(0)|^2$  fixed to 1.

<sup>9</sup> From the combined fit of the  $\tau^-$  data from ANDERSON 00A and SCHAELE 05C and  $e^+e^-$  data from the compilation of BARKOV 85, AKHMETSHIN 04, and ALOISIO 05.  $\rho(1700)$  mass and width fixed at 1713 MeV and 235 MeV, respectively. Supersedes BARATE 97M.

<sup>10</sup>  $\rho(1700)$  mass and width fixed at 1700 MeV and 235 MeV, respectively.

<sup>11</sup>  $\rho(1700)$  mass and width fixed at 1780 MeV and 275 MeV respectively.

<sup>12</sup> T-matrix pole.

<sup>13</sup> Using for  $\rho(1700)$  mass and width  $1600 \pm 20$  and  $300 \pm 10$  MeV respectively.

- 1 Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of LEES 12G and ABLIKIM 16C.
- 2 Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of ACHASOV 06, AKHMETSHIN 07, AUBERT 09AS, and AMBROSINO 11A.
- 3 Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUBNICKA 10 to analyze the data of FUJIKAWA 08.
- 4 From a Dalitz plot analysis in an isobar model with  $\rho(1450)$  and  $\rho(1700)$  masses and widths floating.
- 5 Using the KUHN 90 parametrization of the pion form factor, neglecting  $\rho-\omega$  interference.
- 6 Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the  $\rho(1450)$ ,  $\rho(1700)$ , and  $\rho(2150)$  resonances as free parameters of the fit.
- 7 From the GOUNARIS 68 parametrization of the pion form factor.
- 8  $|F_\pi(0)|^2$  fixed to 1.
- 9 From the combined fit of the  $\tau^-$  data from ANDERSON 00A and SCHAEEL 05C and  $e^+e^-$  data from the compilation of BARKOV 85, AKHMETSHIN 04, and ALOISIO 05.  $\rho(1700)$  mass and width fixed at 1713 MeV and 235 MeV, respectively. Supersedes BARATE 97M.
- 10  $\rho(1700)$  mass and width fixed at 1700 MeV and 235 MeV, respectively.
- 11  $\rho(1700)$  mass and width fixed at 1780 MeV and 275 MeV respectively.
- 12 T-matrix pole.
- 13 Using for  $\rho(1700)$  mass and width  $1600 \pm 20$  and  $300 \pm 10$  MeV respectively.

1 T-matrix pole.

2 Average between  $\pi^+ \pi^- 2\pi^0$  and  $2(\pi^+ \pi^-)$ .

3 T-matrix pole. Coupled-channel analysis of AMSLER 95B, AMSLER 95C, and AMSLER 94D.

4 T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ( $\pi\pi$ ), LONGACRE 86 ( $K\bar{K}$ ), BINON 83 ( $\eta\eta$ ), and BINON 84c ( $\eta\eta'$ ).

5 T-matrix pole of 3 channel unitary model fit to data from AAIJ 14BR and AAIJ 17V extracted using Pade approximants.

6 Using CLEO-c data but not authored by the CLEO Collaboration.

- 7 From a fit to a Breit-Wigner line shape with fixed  $\Gamma = 109$  MeV.  
 8 Solution 1, statistical error only.  
 9 From partial wave analysis including all possible combinations of  $0^{++}$ ,  $2^{++}$ , and  $4^{++}$  resonances.  
 10 Reanalysis of AITALA 01A data. This state could also be  $f_0(1370)$ .  
 11 Breit-Wigner mass. May also be the  $f_0(1370)$ .  
 12 Breit-Wigner mass.  
 13 Statistical error only.  
 14 Breit-Wigner, solution 1, PWA ambiguous.  
 15 K-matrix pole from combined analysis of  $\pi^- p \rightarrow \pi^0 \pi^0 n$ ,  $\pi^- p \rightarrow K \bar{K} n$ ,  $\pi^+ \pi^- \rightarrow \pi^+ \pi^-$ ,  $\bar{p} p \rightarrow \pi^0 \pi^0 \pi^0$ ,  $\pi^0 \eta \eta$ ,  $\pi^0 \pi^0 \eta$ ,  $\pi^+ \pi^- \pi^0$ ,  $K^+ K^- \pi^0$ ,  $K_S^0 K_S^0 \pi^0$ ,  $K^+ K_S^0 \pi^-$  at rest,  $\bar{p} n \rightarrow \pi^- \pi^- \pi^+$ ,  $K_S^0 K^- \pi^0$ ,  $K_S^0 K_S^0 \pi^-$  at rest.  
 16 Supersedes BARBERIS 99 and BARBERIS 99B.  
 17 T-matrix pole on sheet  $--+$ .  
 18 T-matrix pole, supersedes ANISOVICH 94.  
 19 T-matrix pole, supersedes ANISOVICH 94 and AMSLER 92.  
 20 Supersedes ABATZIS 94, ARMSTRONG 89E. Breit-Wigner mass.  
 21 From a simultaneous analysis of the annihilations  $\bar{p} p \rightarrow 3\pi^0, \pi^0 \eta \eta$ .  
 22 Reanalysis of ANISOVICH 94 data.  
 23 From central value and spread of two solutions. Breit-Wigner mass.

**CONSTRAINED FIT INFORMATION**

An overall fit to 6 branching ratios uses 10 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 5.6$  for 6 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

**$86.9^{+2.3}_{-2.1}$  OUR AVERAGE** Includes data from the 5 datablocks that follow this one.

Error includes scale factor of 1.4. See the ideogram below.

• • • We do not use the following data for averages, fits, limits, etc. • • •

102  $\pm 42$  TIKHOMIROV 03 SPEC 40.0  $\pi^- C \rightarrow K_S^0 K_S^0 K_L^0 X$

108  $^{+5}_{-2}$  <sup>1</sup> LONGACRE 86 MPS 22  $\pi^- p \rightarrow K_S^0 K_S^0 n$

69  $^{+22}_{-16}$  <sup>2</sup> CHABAUD 81 ASPK 6  $\pi^- p \rightarrow K^+ K^- n$

137  $^{+23}_{-21}$  CHABAUD 81 ASPK 18.4  $\pi^- p \rightarrow K^+ K^- n$

150  $^{+83}_{-50}$  GORLICH 80 ASPK 17  $\pi^- p$  polarized  $\rightarrow K^+ K^- n$

165  $\pm 42$  <sup>3</sup> CORDEN 79 OMEG 12-15  $\pi^- p \rightarrow \pi^+ \pi^- n$

92  $^{+39}_{-22}$  <sup>4</sup> POLYCHRO... 79 STRC 7  $\pi^- p \rightarrow n K_S^0 K_S^0$

<sup>1</sup> From a partial-wave analysis of data using a K-matrix formalism with 5 poles.

<sup>2</sup> CHABAUD 81 is a reanalysis of PAWLICKI 77 data.

<sup>3</sup> From an amplitude analysis where the  $f_2'(1525)$  width and elasticity are in complete disagreement with the values obtained from  $K\bar{K}$  channel, making the solution dubious.

<sup>4</sup> From a fit to the  $D$  with  $f_2(1270)$ - $f_2'(1525)$  interference. Mass fixed at 1516 MeV.

**CONSTRAINED FIT INFORMATION**

An overall fit to the total width, 2 partial widths, a combination of partial widths obtained from integrated cross sections, and 3 branching ratios uses 17 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 18.2$  for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

**$f_2(1565)$** 

$$I^G(J^{PC}) = 0^+(2^{++})$$

OMITTED FROM SUMMARY TABLE

Seen mostly in antinucleon-nucleon annihilation. Needs confirmation in other channels.

OCCUR=2

- <sup>11</sup> T-matrix pole.  
<sup>12</sup> On sheet II in a two-pole solution.  
<sup>13</sup> Supersedes the  $\omega\omega$  state of BELADIDZE 92B earlier assigned to the  $f_2(1640)$ .  
<sup>14</sup> Breit-Wigner width.  
<sup>15</sup> T-matrix pole, large coupling to  $\rho\rho$  and  $\omega\omega$ , could be  $f_2(1640)$ .  
<sup>16</sup> Coupled-channel analysis of AMSLER 95B, AMSLER 95C, and AMSLER 94D.  
<sup>17</sup> From a simultaneous analysis of the annihilations  $\bar{p}p \rightarrow 3\pi^0, \pi^0 \eta \eta$  including AKER 91 data.  
<sup>18</sup> Supersedes ADAMO 92.  
<sup>19</sup>  $J^P$  not determined, could be partly  $f_0(1500)$ .  
<sup>20</sup>  $J^P$  not determined.  
<sup>21</sup> Superseded by AMSLER 95B.

<sup>1</sup> From a fit with contributions from  $\omega(1420)$ ,  $\omega(1650)$ , and  $\phi(1680)$ . The mass of  $\omega(1420)$  is fixed to the PDG 18 value of 1420 MeV. Fixing also the width of  $\omega(1420)$  to the PDG 18 value of 220 MeV results in  $1694 \pm 9$  MeV measurement.

<sup>2</sup> Could also be  $\rho(1700)$ . Branching ratio  $J/\psi \rightarrow X\pi^0 \rightarrow K^+K^-\pi^0 = (5.3 \pm 0.3^{+0.6}_{-0.5}) \times 10^{-5}$ .

<sup>3</sup> From a fit of the interfering  $\omega(1420)$  and  $\omega(1650)$  with a relative phase of  $\pi$  and other parameters floating.

<sup>4</sup> From a fit with contributions from  $\omega(1420)$ ,  $\omega(1650)$ , and  $\phi(1680)$ .

<sup>5</sup> From a fit with contributions from  $\omega(782)$ ,  $\phi(1020)$ ,  $\omega(1420)$ , and  $\omega(1650)$ . See ACHASOV 20A for a further analysis of the  $\pi^+\pi^-\pi^0$  data.

<sup>6</sup> From the combined fit of ANTONELLI 92, ACHASOV 01E, ACHASOV 02E, and ACHASOV 03D data on the  $\pi^+\pi^-\pi^0$  and ANTONELLI 92 on the  $\omega\pi^+\pi^-$  final states. Supersedes ACHASOV 99E and ACHASOV 02E.

<sup>7</sup> Using results of CORDIER 81 and preliminary data of DOLINSKY 91 and ANTONELLI 92.

<sup>8</sup> Using the data of AKHMETSHIN 00D and ANTONELLI 92. The  $\rho\pi$  dominance for the energy dependence of the  $\omega(1420)$  and  $\omega(1650)$  width assumed.

<sup>9</sup> Using data from BARKOV 87, DOLINSKY 91, and ANTONELLI 92.

<sup>10</sup> Using the data from ANTONELLI 92.

<sup>11</sup> Using the data from IVANOV 81 and BISELLO 88B.

<sup>12</sup> Using the data from BISELLO 91C.

<sup>13</sup> From a fit to two Breit-Wigner functions and using the data of DOLINSKY 91 and ANTONELLI 92.

<sup>14</sup> From the combined fit of the  $\rho\pi$  and  $\omega\pi\pi$  final states.

- <sup>1</sup> From a fit with contributions from  $\omega(1420)$ ,  $\omega(1650)$ , and  $\phi(1680)$ . The mass of  $\omega(1420)$  is fixed to the PDG 18 value of 1420 MeV. Fixing also the width of  $\omega(1420)$  to the PDG 18 value of 220 MeV results in  $(5.4 \pm 0.6) \times 10^{-7}$  measurement.
- <sup>2</sup> From a fit of the interfering  $\omega(1420)$  and  $\omega(1650)$  with a relative phase of  $\pi$  and other parameters floating. From an alternative fit  $\Gamma(\omega(1650) \rightarrow \omega\eta)/\Gamma_{\text{total}} \times \Gamma(\omega(1650) \rightarrow e^+e^-) = 51 \pm 3$  eV.
- <sup>3</sup> From a fit with contributions from  $\omega(1420)$ ,  $\omega(1650)$ , and  $\phi(1680)$ .
- <sup>4</sup>  $\omega(1650)$  mass and width fixed at 1700 MeV and 250 MeV, respectively.

### $\omega(1650)$ BRANCHING RATIOS

$$\Gamma(\rho\pi)/\Gamma_{\text{total}} \quad \Gamma_1/\Gamma$$

### CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 6 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 1.9$  for 3 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

|       |       |       |       |
|-------|-------|-------|-------|
| $x_5$ | −53   |       |       |

OCCUR=4

<sup>1</sup> Seen in  $\psi(2S)$  decay with branching ratio  $\psi(2S) \rightarrow X \eta \rightarrow K^+ K^- \eta = (12.0 \pm 1.3^{+6.5}_{-6.9}) \times 10^{-6}$ .

<sup>2</sup> From a fit using a vector meson dominance model with contribution from  $\rho(770)$ ,  $\omega(782)$ ,  $\phi(1020)$ ,  $\omega(1420)$ ,  $\rho(1450)$ .

<sup>3</sup> From a fit with coherent interference of the  $\phi(1680)$  with a non-resonant contribution.

<sup>4</sup> Assuming the  $K \bar{K}^*(892) + \text{c.c.}$  dynamics. Systematic uncertainties not estimated.

<sup>5</sup> Using a vector meson dominance model with contribution from  $\phi(1020)$ ,  $\phi(1680)$ , and higher mass excitations of  $\rho(770)$  and  $\omega(782)$ .

<sup>6</sup> Using events with  $\pi\pi$  invariant mass less than 0.85 GeV.

<sup>7</sup> From a fit with two incoherent Breit-Wigners.

<sup>8</sup> From the simultaneous fit to the  $K \bar{K}^*(892) + \text{c.c.}$  and  $\phi\eta$  data from AUBERT 08S using the results of AUBERT 07AK.

- <sup>9</sup> From the combined fit of AKHMETSHIN 03 and MANE 81 also including  $\rho$ ,  $\omega$ , and  $\phi$ . Neither isospin nor flavor structure known.
- <sup>10</sup> Using data from IVANOV 81, BARKOV 87, BISELLO 88B, DOLINSKY 91, and ANTONELLI 92.
- <sup>11</sup> Using the data from BISELLO 91C.
- <sup>12</sup> Using BISELLO 88B and MANE 82 data.
- <sup>13</sup> From global fit including  $\rho$ ,  $\omega$ ,  $\phi$  and  $\rho(1700)$  assume mass 1570 MeV and width 510 MeV for  $\rho$  radial excitation.
- <sup>14</sup> From global fit of  $\rho$ ,  $\omega$ ,  $\phi$  and their radial excitations to channels  $\omega\pi^+\pi^-$ ,  $K^+K^-$ ,  $K_S^0K_L^0$ ,  $K_S^0K^\pm\pi^\mp$ . Assume mass 1570 MeV and width 510 MeV for  $\rho$  radial excitations, mass 1570 and width 500 MeV for  $\omega$  radial excitation.
- <sup>15</sup> Fit to one channel only, neglecting interference with  $\omega$ ,  $\rho(1700)$ .

## $\phi(1680) \Gamma(i) \Gamma(e^+ e^-) / \Gamma(\text{total})$

NODE=M067220

NODE=M067220

This combination of a partial width with the partial width into  $e^+ e^-$  and with the total width is obtained from the integrated cross section into channel (I) in  $e^+ e^-$  annihilation. We list only data that have not been used to determine the partial width  $\Gamma(I)$  or the branching ratio  $\Gamma(I)/\text{total}$ .

<sup>1</sup> Mass errors enlarged by us to  $\Gamma/\sqrt{N}$ ; see the note with the  $K^*(892)$  mass.<sup>2</sup> Uses same data as HYAMS 75.<sup>3</sup> From a phase shift solution containing a  $f_2'(1525)$  width two times larger than the  $K\bar{K}$  result.<sup>4</sup> From phase-shift analysis. Error takes account of spread of different phase-shift solutions.

**CONSTRAINED FIT INFORMATION**

An overall fit to 5 branching ratios uses 10 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 14.7$  for 7 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

**THE  $\rho(1450)$  AND THE  $\rho(1700)$** 

Updated September 2019 by S. Eidelman (Novosibirsk), C. Hanhart (Juelich) and G. Venanzoni (Pisa).

In our 1988 edition, we replaced the  $\rho(1600)$  entry with two new ones, the  $\rho(1450)$  and the  $\rho(1700)$ , because there was emerging evidence that the 1600-MeV region actually contains two  $\rho$ -like resonances. Erkal [1] had pointed out this possibility with a theoretical analysis on the consistency of  $2\pi$  and  $4\pi$  electromagnetic form factors and the  $\pi\pi$  scattering length. Donnachie [2], with a full analysis of data on the  $2\pi$  and  $4\pi$  final states in  $e^+e^-$  annihilation and photoproduction reactions, had also argued that in order to obtain a consistent picture, two resonances were necessary. The existence of  $\rho(1450)$  was supported by the analysis of  $\eta\rho^0$  mass spectra obtained in photoproduction and  $e^+e^-$  annihilation [3], as well as that of  $e^+e^- \rightarrow \omega\pi$  [4].

The analysis of [2] was further extended by [5,6] to include new data on  $4\pi$ -systems produced in  $e^+e^-$  annihilation, and in  $\tau$ -decays ( $\tau$  decays to  $4\pi$ , and  $e^+e^-$  annihilation to  $4\pi$  can be

related by the Conserved Vector Current assumption). These systems were successfully analyzed using interfering contributions from two  $\rho$ -like states, and from the tail of the  $\rho(770)$  decaying into two-body states. While specific conclusions on  $\rho(1450) \rightarrow 4\pi$  were obtained, little could be said about the  $\rho(1700)$ .

Independent evidence for two  $1^-$  states is provided by [7] in  $4\pi$  electroproduction at  $\langle Q^2 \rangle = 1$  (GeV/c)<sup>2</sup>, and by [8] in a high-statistics sample of the  $\eta\pi\pi$  system in  $\pi^-p$  charge exchange.

This scenario with two overlapping resonances is supported by other data. Bisello [9] measured the pion form factor in the interval 1.35–2.4 GeV, and observed a deep minimum around 1.6 GeV. The best fit was obtained with the hypothesis of  $\rho$ -like resonances at 1420 and 1770 MeV, with widths of about 250 MeV. Antonelli [10] found that the  $e^+e^- \rightarrow \eta\pi^+\pi^-$  cross section is better fitted with two fully interfering Breit-Wigners, with parameters in fair agreement with those of [2] and [9]. These results can be considered as a confirmation of the  $\rho(1450)$ .

Decisive evidence for the  $\pi\pi$  decay mode of both  $\rho(1450)$  and  $\rho(1700)$  comes from  $\bar{p}p$  annihilation at rest [11]. It has been shown that these resonances also possess a  $K\bar{K}$  decay mode [12–14]. High-statistics studies of the decays  $\tau \rightarrow \pi\pi\nu_\tau$  [15,16], and  $\tau \rightarrow 4\pi\nu_\tau$  [17] also require the  $\rho(1450)$ , but are not sensitive to the  $\rho(1700)$ , because it is too close to the  $\tau$  mass. A recent very-high-statistics study of the  $\tau \rightarrow \pi\pi\nu_\tau$  decay performed at Belle [18] reports the first observation of both  $\rho(1450)$  and  $\rho(1700)$  in  $\tau$  decays. A clear picture of the two  $\pi^+\pi^-$  resonances interfering with the  $\rho(770)$  in  $e^+e^-$  annihilation was also reported by BaBar using the ISR method [19].

The structure of these  $\rho$  states is not yet completely clear. Barnes [20] and Close [21] claim that  $\rho(1450)$  has a mass consistent with radial  $2S$ , but its decays show characteristics of hybrids, and suggest that this state may be a  $2S$ -hybrid mixture. Donnachie [22] argues that hybrid states could have a  $4\pi$  decay mode dominated by the  $a_1\pi$ . Such behavior has been observed by [23] in  $e^+e^- \rightarrow 4\pi$  in the energy range 1.05–1.38 GeV, and by [17] in  $\tau \rightarrow 4\pi$  decays. CLEO [24] and Belle [25] observe the  $\rho(1450) \rightarrow \omega\pi$  decay mode in  $B$ -meson decays, however, do not find  $\rho(1700) \rightarrow \omega\pi^0$ . A similar conclusion is made by [26,27], who studied the process  $e^+e^- \rightarrow \omega\pi^0$  and do not observe a statistically significant signal of the  $\rho(1700)$ . Various

decay modes of the  $\rho(1450)$  and  $\rho(1700)$  are observed in  $\bar{p}n$  and  $\bar{p}p$  annihilation [28,29], but no definite conclusions can be drawn. More data should be collected to clarify the nature of the  $\rho$  states, particularly in the energy range above 1.6 GeV.

We now list under a separate entry the  $\rho(1570)$ , the  $\phi\pi$  state with  $J^{PC} = 1^{--}$  earlier observed by [30] (referred to as  $C(1480)$ ) and recently confirmed by [31]. While [32] shows that it may be a threshold effect, [5] and [33] suggest two independent vector states with this decay mode. The  $C(1480)$  has not been seen in the  $\bar{p}p$  [34] and  $e^+e^-$  [35,36] experiments. However, the sensitivity of the two latter is an order of magnitude lower than that of [31]. Note that [31] can not exclude that their observation is due to an OZI-suppressed decay mode of the  $\rho(1700)$ .

Several observations on the  $\omega\pi$  system in the 1200-MeV region [37–43] may be interpreted in terms of either  $J^P = 1^-$   $\rho(770) \rightarrow \omega\pi$  production [44], or  $J^P = 1^+$   $b_1(1235)$  production [42,43]. We argue that no special entry for a  $\rho(1250)$  is needed. The LASS amplitude analysis [45] showing evidence for  $\rho(1270)$  is preliminary and needs confirmation. For completeness, the relevant observations are listed under the  $\rho(1450)$ .

Recently [46] reported a very broad  $1^{--}$  resonance-like  $K^+K^-$  state in  $J/\psi \rightarrow K^+K^-\pi^0$  decays. Its pole position corresponds to mass of 1576 MeV and width of 818 MeV. [47–49] suggest its exotic structure (molecular or multiquark), while [50] and [51] explain it by the interference between the  $\rho(1450)$  and  $\rho(1700)$ . The latter statement is qualitatively supported by BaBar [52] and SND [53]. We quote [46] as  $X(1575)$  in the section “Further States.”

Evidence for  $\rho$ -like mesons decaying into  $6\pi$  states was first noted by [54] in the analysis of  $6\pi$  mass spectra from  $e^+e^-$  annihilation [55,56] and diffractive photoproduction [57]. Clegg [54] argued that two states at about 2.1 and 1.8 GeV exist: while the former is a candidate for the  $\rho(2150)$ , the latter could be a manifestation of the  $\rho(1700)$  distorted by threshold effects. BaBar reported observations of the new decay modes of the  $\rho(2150)$  in the channels  $\eta'(958)\pi^+\pi^-$  and  $f_1(1285)\pi^+\pi^-$  [58]. The relativistic quark model [59] predicts the  $2^3D_1$  state with  $J^{PC} = 1^{--}$  at 2.15 GeV which can be identified with the  $\rho(2150)$ .

We no longer list under a separate particle  $\rho(1900)$  various observations of irregular behavior of the cross sections

near the  $N\bar{N}$  threshold. Dips of various width around 1.9 GeV were reported by the E687 Collaboration (a narrow one in the  $3\pi^+3\pi^-$  diffractive photoproduction [60,61]) , by the FENICE experiment (a narrow structure in the  $R$  value [62]) , by BaBar in ISR (a narrow structure in  $e^+e^- \rightarrow \phi\pi$  final state [63], but much broader in  $e^+e^- \rightarrow 3\pi^+3\pi^-$  and  $e^+e^- \rightarrow 2(\pi^+\pi^-\pi^0)$  [64]) , by CMD-3 (also a rather broad dip in  $e^+e^- \rightarrow 3\pi^+3\pi^-$  [65]) . A dedicated scan of the  $N\bar{N}$ -threshold region by CMD-3 confirms this effect in the  $e^+e^- \rightarrow 3\pi^+3\pi^-$  and  $e^+e^- \rightarrow K^+K^-\pi^+\pi^-$  final states, but does not see it in the cross section of  $e^+e^- \rightarrow 2\pi^+2\pi^-$  [66]. Most probably, these structures emerge as a threshold effect due to the opening of the  $N\bar{N}$  channel [67,68,69].

| 1701±15 |       | <sup>3</sup> FUKUI    | 88 | SPEC | 8.95 $\pi^-p \rightarrow \eta\pi^+\pi^-n$     |

<sup>1</sup> Mass and width of the  $\rho(770)$  fixed at 775 and 149 MeV, respectively; solution 2 of model 2,  $\eta \rightarrow \gamma\gamma$  decays used.

<sup>2</sup> From the combined fit of AULCHENKO 15 and ACHASOV 18 in the model with the interfering  $\rho(1450)$ ,  $\rho(1700)$  and  $\rho(2150)$  with the parameters of the  $\rho(1450)$  and  $\rho(1700)$  floating and the mass and width of the  $\rho(2150)$  fixed at 2155 MeV and 320 MeV, respectively. The phases of the resonances are  $\pi$ , 0 and  $\pi$ , respectively.

<sup>3</sup> Assuming  $\rho^+f_0(1370)$  decay mode interferes with  $a_1(1260)^+\pi$  background. From a two Breit-Wigner fit.

- 4 From a Dalitz plot analysis in an isobar model with  $\rho(1450)$  and  $\rho(1700)$  masses and widths floating.
- 5 Using the KUHN 90 parametrization of the pion form factor, neglecting  $\rho-\omega$  interference.
- 6 Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the  $\rho(1450)$ ,  $\rho(1700)$ , and  $\rho(2150)$  resonances as free parameters of the fit.
- 7  $|F_\pi(0)|^2$  fixed to 1.
- 8 From the GOUNARIS 68 parametrization of the pion form factor.
- 9 T-matrix pole.
- 10 From phase shift analysis of HYAMS 73 data.
- 11 Simple relativistic Breit-Wigner fit with constant width.
- 12 An additional 40 MeV uncertainty in both the mass and width is present due to the choice of the background shape.
- 13 Included in BECKER 79 analysis.

<sup>1</sup> Mass and width of the  $\rho(770)$  fixed at 775 and 149 MeV, respectively; solution 2 of model 2,  $\eta \rightarrow \gamma\gamma$  decays used.

<sup>2</sup> From the combined fit of AULCHENKO 15 and ACHASOV 18 in the model with the interfering  $\rho(1450)$ ,  $\rho(1700)$  and  $\rho(2150)$  with the parameters of the  $\rho(1450)$  and  $\rho(1700)$  floating and the mass and width of the  $\rho(2150)$  fixed at 2155 MeV and 320 MeV, respectively. The phases of the resonances are  $\pi$ , 0 and  $\pi$ , respectively.

<sup>3</sup> Assuming  $\rho^+ f_0(1370)$  decay mode interferes with  $a_1(1260)^+\pi$  background. From a two Breit-Wigner fit.

OCCUR=2

- <sup>1</sup> Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUB-NICKA 10 to analyze the data of LEES 12G and ABLIKIM 16C.
- <sup>2</sup> Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUB-NICKA 10 to analyze the data of ACHASOV 06, AKHMETSHIN 07, AUBERT 09AS, and AMBROSINO 11A.
- <sup>3</sup> Applies the Unitary & Analytic Model of the pion electromagnetic form factor of DUB-NICKA 10 to analyze the data of FUJIKAWA 08.
- <sup>4</sup> From a Dalitz plot analysis in an isobar model with  $\rho(1450)$  and  $\rho(1700)$  masses and widths floating.
- <sup>5</sup> Using the KUHN 90 parametrization of the pion form factor, neglecting  $\rho-\omega$  interference.
- <sup>6</sup> Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the  $\rho(1450)$ ,  $\rho(1700)$ , and  $\rho(2150)$  resonances as free parameters of the fit.
- <sup>7</sup>  $|F_\pi(0)|^2$  fixed to 1.
- <sup>8</sup> From the GOUNARIS 68 parametrization of the pion form factor.
- <sup>9</sup> T-matrix pole.
- <sup>10</sup> From phase shift analysis of HYAMS 73 data.
- <sup>11</sup> Simple relativistic Breit-Wigner fit with constant width.
- <sup>12</sup> An additional 40 MeV uncertainty in both the mass and width is present due to the choice of the background shape.
- <sup>13</sup> Included in BECKER 79 analysis.

NEW

- <sup>1</sup> T-matrix pole.
- <sup>2</sup> T-matrix pole, 2 poles, 2 channels ( $\pi\eta$ ,  $K\bar{K}$ ).
- <sup>3</sup> The coupled-channel analysis of both the  $\eta\pi$  and  $\eta'\pi$  systems using ADOLPH 15 data. The width is extracted from the T-matrix pole.
- <sup>4</sup> Statistical error negligible.
- <sup>5</sup> Breit-Wigner width.
- <sup>6</sup> Superseded by RODAS 19.
- <sup>7</sup> From analysis of L3 data at 183–209 GeV.
- <sup>8</sup> Statistical error only.
- <sup>9</sup> Spin 2 dominant, isospin not determined, could also be  $I=1$ .

### $a_2(1700)$ DECAY MODES

| Mode                          | Fraction ( $\Gamma_i/\Gamma$ )     |
|-------------------------------|------------------------------------|
| $\Gamma_1$ $\eta\pi$          | (3.6 $\pm$ 1.1 ) %                 |
| $\Gamma_2$ $\gamma\gamma$     | (1.13 $\pm$ 0.30) $\times 10^{-6}$ |
| $\Gamma_3$ $\rho\pi$          | seen                               |

<sup>1</sup> From partial wave analysis including all possible combinations of  $0^{++}$ ,  $2^{++}$ , and  $4^{++}$  resonances.

<sup>2</sup> Spin 0 favored over spin 2.

<sup>3</sup> In the SU(3) based model with a specific interference pattern of the  $f_2(1270)$ ,  $a_2^0(1320)$ , and  $f_2'(1525)$  mesons incoherently added to the  $f_0(1710)$  and non-resonant background.

<sup>4</sup> Breit-Wigner mass.

<sup>5</sup>  $J^P = 0^+$ , supersedes by ARMSTRONG 89D.

<sup>6</sup> T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ( $\pi\pi$ ), LONGACRE 86 ( $K\bar{K}$ ), BINON 83 ( $\eta\eta$ ), and BINON 84C ( $\eta\eta'$ ).

- 7 Using CLEO-c data but not authored by the CLEO Collaboration.  
 8 From a fit to a Breit-Wigner line shape with fixed  $\Gamma = 135$  MeV.  
 9 Not seen by LIU 09 in  $B^\pm \rightarrow K^\pm \omega \phi$ .  
 10 Systematic errors not estimated.  
 11 This state may be different from  $f_0(1710)$ , see CLOSE 05.  
 12 K-matrix pole, assuming  $J^P = 0^+$ , from combined analysis of  $\pi^- p \rightarrow \pi^0 \pi^0 n$ ,  $\pi^- p \rightarrow K \bar{K} n$ ,  $\pi^+ \pi^- \rightarrow \pi^+ \pi^-$ ,  $\bar{p} p \rightarrow \pi^0 \pi^0 \pi^0$ ,  $\pi^0 \eta \eta$ ,  $\pi^0 \pi^0 \eta$ ,  $\pi^+ \pi^- \pi^0$ ,  $K^+ K^- \pi^0$ ,  $K_S^0 K_S^0 \pi^0$ ,  $K^+ K_S^0 \pi^-$  at rest,  $\bar{p} n \rightarrow \pi^- \pi^- \pi^+$ ,  $K_S^0 K^- \pi^0$ ,  $K_S^0 K_S^0 \pi^-$  at rest.  
 13 Decaying to  $f_0(1370) \pi \pi$ .  
 14 T-matrix pole.  
 15 Not seen by AMSLER 02.  
 16 Supersedes BARBERIS 99 and BARBERIS 99B.  
 17 T-matrix pole, assuming  $J^P = 0^+$   
 18 No  $J^{PC}$  determination.  
 19 No  $J^{PC}$  determination, width not determined.  
 20  $J^P = 2^+$ .  
 21 From a fit to the  $0^+$  partial wave.  
 22 No  $J^{PC}$  determination.  
 23 ALDE 92D combines all the GAMS-2000 data.  
 24  $J^P = 2^+$ , superseded by FRENCH 99.  
 25 From an analysis ignoring interference with  $f_2'(1525)$ .  
 26 From an analysis including interference with  $f_2'(1525)$ .  
 27 Superseded by ALDE 92D.  
 28 Uses MRK3 data. From a partial-wave analysis of data using a K-matrix formalism with 5 poles, but assuming spin 2. Fit with constrained inelasticity.  
 29  $J^P = 2^+$  preferred.  
 30 From fit neglecting nearby  $f_2'(1525)$ . Replaced by BLOOM 83.  
 31 Superseded by LONGACRE 86.

NODE=M068W;LINKAGE=G

NODE=M068W;LINKAGE=HE

- <sup>4</sup> Breit-Wigner width.
- <sup>5</sup>  $J^P = 0^+$ , supersedes by ARMSTRONG 89D.
- <sup>6</sup> T-matrix pole, 5 poles, 5 channels, including scattering data from HYAMS 75 ( $\pi\pi$ ), LONGACRE 86 ( $K\bar{K}$ ), BINON 83 ( $\eta\eta$ ), and BINON 84C ( $\eta\eta'$ ).
- <sup>7</sup> Not seen by LIU 09 in  $B^\pm \rightarrow K^\pm \omega \phi$ .
- <sup>8</sup> Systematic errors not estimated.
- <sup>9</sup> This state may be different from  $f_0(1710)$ , see CLOSE 05.
- <sup>10</sup> (Solution I)
- <sup>11</sup> K-matrix pole, assuming  $J^P = 0^+$ , from combined analysis of  $\pi^- p \rightarrow \pi^0 \pi^0 n$ ,  $\pi^- p \rightarrow K\bar{K} n$ ,  $\pi^+ \pi^- \rightarrow \pi^+ \pi^-$ ,  $\bar{p} p \rightarrow \pi^0 \pi^0 \pi^0$ ,  $\pi^0 \eta \eta$ ,  $\pi^0 \pi^0 \eta$ ,  $\pi^+ \pi^- \pi^0$ ,  $K^+ K^- \pi^0$ ,  $K_S^0 K_S^0 \pi^0$ ,  $K^+ K_S^0 \pi^-$  at rest,  $\bar{p} n \rightarrow \pi^- \pi^- \pi^+$ ,  $K_S^0 K^- \pi^0$ ,  $K_S^0 K_S^0 \pi^-$  at rest.
- <sup>12</sup> Solution I.
- <sup>13</sup> Decaying to  $f_0(1370) \pi \pi$ .
- <sup>14</sup> T-matrix pole.
- <sup>15</sup>  $J^P = 0^+$ .
- <sup>16</sup> Not seen by AMSLER 02.
- <sup>17</sup> Supersedes BARBERIS 99 and BARBERIS 99B.
- <sup>18</sup> T-matrix pole, assuming  $J^P = 0^+$
- <sup>19</sup> No  $J^{PC}$  determination.
- <sup>20</sup>  $J^P = 2^+$ .
- <sup>21</sup> From a fit to the  $0^+$  partial wave.
- <sup>22</sup> No  $J^{PC}$  determination.
- <sup>23</sup> ALDE 92D combines all the GAMS-2000 data.
- <sup>24</sup>  $J^P = 2^+$ , ( $0^+$  excluded).
- <sup>25</sup> From an analysis ignoring interference with  $f_2'(1525)$ .
- <sup>26</sup> From an analysis including interference with  $f_2'(1525)$ .
- <sup>27</sup> Uses MRK3 data. From a partial-wave analysis of data using a K-matrix formalism with 5 poles, but assuming spin 2. Fit with constrained inelasticity.
- <sup>28</sup> No  $J^{PC}$  determination.
- <sup>29</sup>  $J^P = 2^+$  preferred.
- <sup>30</sup> From fit neglecting nearby  $f_2'(1525)$ . Replaced by BLOOM 83.
- <sup>31</sup> From an amplitude analysis of the  $K_S^0 K_S^0$  system, superseded by LONGACRE 86.

**$\eta(1760)$** 

$$I^G(J^{PC}) = 0^+(0^-+)$$

NODE=M114

## OMITTED FROM SUMMARY TABLE

Seen by DM2 in the  $\rho\rho$  system (BISELLO 89B). Structure in this region has been reported before in the same system (BALTRUSAITIS 86B) and in the  $\omega\omega$  system (BALTRUSAITIS 85C, BISELLO 87).

<sup>1</sup> From partial wave analysis including all possible combinations of  $0^{++}$ ,  $2^{++}$ , and  $4^{++}$  resonances.

<sup>2</sup> Breit-Wigner mass. Could also be the  $f_2(1910)$ .

<sup>3</sup> Seen in only one solution.

<sup>4</sup> Error increased by spread of two solutions. Included in LONGACRE 86 global analysis.

<sup>5</sup> T-matrix pole, 4 poles, 4 channels, including scattering data from HYAMS 75 ( $\pi\pi$ ), LONGACRE 86 ( $K\bar{K}$ ), BINON 83 ( $\eta\eta$ ).

<sup>6</sup> From a partial-wave analysis of data using a K-matrix formalism with 5 poles. Includes compilation of several other experiments.

<sup>7</sup> From an amplitude analysis of the reaction  $\pi^+\pi^- \rightarrow 2\pi^0$ . The resonance in the  $2\pi^0$  final state is not confirmed by PROKOSHKIN 97.

**X(1835)**

$$J^{PC} = ?(0^{-+})$$

NODE=M085

## OMITTED FROM SUMMARY TABLE

Could be a superposition of two states, one with small width appearing as threshold enhancement in  $p\bar{p}$ , the other one with a larger width. For the former ABLIKIM 12D determine  $J^{PC} = 0^{-+}$ .

NODE=M085

OCCUR=2

OCCUR=2

<sup>1</sup> From a fit of the measured  $\pi^+ \pi^- \eta'$  lineshape that accounts for the abrupt distortion observed at the  $p\bar{p}$  threshold through interference with a second previously unseen narrow resonance near 1870 MeV. The fit uses Breit-Wigner functions for the signal shapes and includes known backgrounds and contributors.

NODE=M085M;LINKAGE=B

<sup>2</sup> From a fit to  $\gamma \phi$  invariant mass. Angular analysis consistent with  $J^{PC} = 0^{-+}$ . Other  $J^{PC}$  not excluded.

NODE=M085M;LINKAGE=C

<sup>3</sup> Pole mass from a fit of the measured  $\pi^+ \pi^- \eta'$  lineshape to a Flatte formula that accounts for the abrupt distortion observed at the  $p\bar{p}$  threshold; the fit also includes known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner function ( $M \approx 1919$  MeV;  $\Gamma \approx 51$  MeV) that is required for a good fit.

NODE=M085M;LINKAGE=A

<sup>4</sup> From the fit including final state interaction effects in isospin 0  $S$ -wave according to SIBIRTSEV 05A. Supersedes ABLIKIM 10G.

NODE=M085M;LINKAGE=AK

<sup>5</sup> From a fit of the  $\pi^+ \pi^- \eta'$  mass distribution to a combination of  $\gamma f_1(1510)$ ,  $\gamma X(1835)$ , and two states  $\gamma X(2120)$  and  $\gamma X(2370)$ , for  $M(\pi^+ \pi^- \eta') < 2.8$  GeV, and accounting for backgrounds from non- $\eta'$  events and  $J/\psi \rightarrow \pi^0 \pi^+ \pi^- \eta'$ .

NODE=M085M;LINKAGE=AI

<sup>6</sup> The selected process is  $J/\psi \rightarrow \omega a_0(980) \pi$ . This state may be due also to  $\eta_2(1870)$  or to a combination of  $X(1835)$  and  $\eta_2(1870)$ .

NODE=M085M;LINKAGE=BL

<sup>7</sup> From a fit of the  $p\bar{p}$  mass distribution to a combination of  $\gamma X(1835)$ ,  $\gamma R$  with  $M(R) = 2100$  MeV and  $\Gamma(R) = 160$  MeV, and  $\gamma p\bar{p}$  phase space, for  $M(p\bar{p}) < 2.85$  GeV.

NODE=M085M;LINKAGE=AE

<sup>8</sup> Evidence for a threshold enhancement in the  $p\bar{p}$  mass spectrum was also reported by ABE 02K, AUBERT, B 05L, and WANG 05A in  $B^+ \rightarrow p\bar{p} K^+$ , WANG 05A in  $B^0 \rightarrow p\bar{p} K_S^0$ , ABE 02W in  $\bar{B}^0 \rightarrow p\bar{p} D^0$ , DEL-AMO-SANCHEZ 12 in  $B \rightarrow D(D^*) p\bar{p}(\pi)$ , and WEI 08 in  $B^+ \rightarrow p\bar{p} \pi^+$  decays. Not seen by ATHAR 06 in  $\Upsilon(1S) \rightarrow p\bar{p} \gamma$ .

NODE=M085M;LINKAGE=HF

<sup>9</sup> From the fit including final state interaction effects in isospin 0  $S$ -wave according to SIBIRTSEV 05A. Systematic errors not estimated.

NODE=M085M;LINKAGE=AB

| <b>seen</b> | <sup>1</sup> ABLIKIM | 16J | BES3 | $J/\psi \rightarrow \gamma\pi^+\pi^-\eta'$ |
|-------------|----------------------|-----|------|--------------------------------------------|

<sup>1</sup> ABLIKIM 16J quotes  $B(J/\psi \rightarrow \gamma X(1835)) \times B(X(1835) \rightarrow \pi^+\pi^-\eta') = (3.93 \pm 0.38^{+0.31}_{-0.84}) \times 10^{-4}$  from a fit of the measured  $\pi^+\pi^-\eta'$  lineshape that accounts for the abrupt distortion observed at the  $p\bar{p}$  threshold with a Flatte formula in addition to known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner ( $M \approx 1919$  MeV;  $\Gamma \approx 51$  MeV) that is required for a good fit. Another explanation for the distortion provided by ABLIKIM 16J is that a second resonance near 1870 MeV interferes with the  $X(1835)$ ; fits to this possibility yield product branching fraction values compatible with that shown within the respective systematic uncertainties.

 $f_2(1910)$ 

$$I^G(J^{PC}) = 0^+(2^{++})$$

## OMITTED FROM SUMMARY TABLE

We list here three different peaks with close masses and widths seen in the mass distributions of  $\omega\omega$ ,  $\eta\eta'$ , and  $K^+ K^-$  final states. ALDE 91B argues that they are of different nature.

OCCUR=2

- <sup>1</sup>Decaying into  $\pi^+\pi^-2\pi^0$ .
- <sup>2</sup>Decaying into  $2(\pi^+\pi^-)$ .
- <sup>3</sup>T-matrix pole, 4 poles, 4 channels, including scattering data from HYAMS 75 ( $\pi\pi$ ), LONGACRE 86 ( $K\bar{K}$ ), BINON 83 ( $\eta\eta$ ).
- <sup>4</sup>Taking into account  $f_4(2050)$ .
- <sup>5</sup>First solution, PWA is ambiguous.
- <sup>6</sup>T-matrix pole.
- <sup>7</sup>From solution B of amplitude analysis of data on  $\bar{p}p \rightarrow \pi\pi$ . See however KLOET 96 who fit  $\pi^+\pi^-$  only and find waves only up to  $J = 3$  to be important but not significantly resonant.
- <sup>8</sup>Cannot determine spin to be 2.

<sup>1</sup> Statistical error negligible.

<sup>2</sup> From a simultaneous fit to the  $G_+$  and  $G_0$  wave intensities.

<sup>3</sup> From an amplitude analysis.

<sup>4</sup> Superseded by AGHASYAN 2018B.

<sup>5</sup> Statistical error only.

<sup>6</sup> From the combined analysis of ANISOVICH 99C, ANISOVICH 99E, and ANISOVICH 01F.

<sup>7</sup> May be a different state.

<sup>8</sup> From a fit to the  $Y_8^0$  moment. Limited by phase space.

<sup>9</sup>  $J^P = 4^+$  is favored, though  $J^P = 2^+$  cannot be excluded.

OCCUR=2

<sup>12</sup> From the first PWA solution.

<sup>13</sup> From a partial-wave analysis of the data.

<sup>14</sup> From an amplitude analysis of the reaction  $\pi^+ \pi^- \rightarrow 2 \pi^0$ .

<sup>15</sup> K matrix pole.

<sup>16</sup> Taking into account the  $f_2(1950)$ . Helicity-2 production favored.

<sup>17</sup> Energy-dependent analysis.

<sup>18</sup> Single energy analysis.

- 19 From solution A of amplitude analysis of data on  $\bar{p}p \rightarrow \pi\pi$ . See however KLOET 96 who fit  $\pi^+\pi^-$  only and find waves only up to  $J = 3$  to be important but not significantly resonant.
- 20 From solution B of amplitude analysis of data on  $\bar{p}p \rightarrow \pi\pi$ . See however KLOET 96 who fit  $\pi^+\pi^-$  only and find waves only up to  $J = 3$  to be important but not significantly resonant.
- 21  $I(J^P) = 0(4^+)$  from amplitude analysis assuming one-pion exchange.
- 22 Width errors enlarged by us to  $4\Gamma/\sqrt{N}$ ; see the note with the  $K^*(892)$  mass.
