OCCUR=2

OCCUR=2

<sup>1</sup> From a fit to the cross section between 2.00 and 3.08 GeV with a coherent sum of Breit-Wigner amplitudes, including contributions from  $\rho(770)$ ,  $\rho(1450)$  and  $\rho(1700)$ . Could be another state.

<sup>2</sup> Seen in  $\psi(2S)$  decay with branching ratio  $\psi(2S) \rightarrow X\eta \rightarrow K^+K^-\eta = (21.7 \pm 1.9 \pm 7.7) \times 10^{-6}$ .

<sup>3</sup> From the fit to the BABAR data of LEES 13Q assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution. The resonance significance is  $3.5\sigma$ .

<sup>4</sup> From the fit to the BABAR data of LEES 13Q and BESIII data of ABLIKIM 19L assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution.

<sup>5</sup> Could also be another state. Seen in  $J/\psi$  decay with branching ratio  $J/\psi \rightarrow X\pi^0 \rightarrow K^+K^-\pi^0 = (6.7 \pm 1.1 \pm 2.2) \times 10^{-6}$ .

<sup>6</sup> The observed structure can be due to both the  $\phi(2170)$  and  $\rho(2150)$ .

<sup>7</sup> Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the  $\rho(1450)$ ,  $\rho(1700)$ , and  $\rho(2150)$  resonances as free parameters of the fit.

<sup>8</sup> Includes ATKINSON 85.

OCCUR=2

OCCUR=2

<sup>1</sup> From a fit to the cross section between 2.00 and 3.08 GeV with a coherent sum of Breit-Wigner amplitudes, including contributions from  $\rho(770)$ ,  $\rho(1450)$  and  $\rho(1700)$ . Could be another state.

NODE=M032W3;LINKAGE=G

<sup>2</sup> Seen in  $\psi(2S)$  decay with branching ratio  $\psi(2S) \rightarrow X \eta \rightarrow K^+ K^- \eta = (21.7 \pm 1.9^{+7.7}_{-8.3}) \times 10^{-6}$ .

NODE=M032W3;LINKAGE=F

<sup>3</sup> From the fit to the BABAR data of LEES 13Q assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution. The resonance significance is 3.5  $\sigma$ .

NODE=M032W3;LINKAGE=C

<sup>4</sup> From the fit to the BABAR data of LEES 13Q and BESIII data of ABLIKIM 19L assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution.

NODE=M032W3;LINKAGE=D

<sup>5</sup> Could also be another state. Seen in  $J/\psi$  decay with branching ratio  $J/\psi \rightarrow X \pi^0 \rightarrow K^+ K^- \pi^0 = (6.7 \pm 1.1^{+2.2}_{-1.8}) \times 10^{-6}$ .

NODE=M032W3;LINKAGE=B

<sup>6</sup> The observed structure can be due to both the  $\phi(2170)$  and  $\rho(2150)$ .

NODE=M032W3;LINKAGE=E

<sup>7</sup> Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the  $\rho(1450)$ ,  $\rho(1700)$ , and  $\rho(2150)$  resonances as free parameters of the fit.

NODE=M032W3;LINKAGE=LE

<sup>8</sup> Includes ATKINSON 85.

OCCUR=2

<sup>1</sup> From a fit to the cross section between 2.00 and 3.08 GeV with a coherent sum of Breit-Wigner amplitudes, including contributions from  $\omega(1420)$  and  $\omega(1650)/\phi(1680)$ .

NODE=M103M;LINKAGE=F

<sup>2</sup> From a fit using a coherent sum of a phase-space modified Breit-Wigner function and a phase-space term.

NODE=M103M;LINKAGE=D

<sup>3</sup> By a simultaneous fit of the intermediate channels in a partial-wave analysis, assuming the same structure, modelled with a coherent sum of a nonresonant component and a resonant component by a Breit-Wigner function.

NODE=M103M;LINKAGE=E

<sup>4</sup> The observed structure can be due to both the  $\phi(2170)$  and  $\rho(2150)$ .

<sup>5</sup> Fit includes interference with the  $\phi(1680)$ .

<sup>6</sup> From the  $\phi f_0(980)$  component.

NODE=M103M;LINKAGE=C

NODE=M103M;LINKAGE=A

NODE=M103M;LINKAGE=AB

NODE=M103M;LINKAGE=SH

NODE=M103M;LINKAGE=AU

NODE=M103M;LINKAGE=B

<sup>7</sup> From a fit with two incoherent Breit-Wigners.

<sup>8</sup> From the  $K^+K^- f_0(980)$  component.

<sup>9</sup> Superseded by LEES 12F.

 $\phi(2170)$  WIDTH

| $\sim 150$                                                                    |      | <sup>14</sup> CARTER  | 78B  | CNTR 0 | $0.7\text{--}2.4 \bar{p}p \rightarrow K^- K^+$  |
| $\sim 200$                                                                    |      | <sup>15</sup> CARTER  | 77   | CNTR 0 | $0.7\text{--}2.4 \bar{p}p \rightarrow \pi\pi$   |

- <sup>11</sup> Seen in  $\psi(2S)$  decay with branching ratio  $\psi(2S) \rightarrow X\eta \rightarrow K^+ K^- \eta = (1.9 \pm 0.4^{+0.5}_{-1.3}) \times 10^{-6}$ .
- <sup>12</sup> See however KLOET 96 who fit  $\pi^+ \pi^-$  only and find waves only up to  $J = 3$  to be important but not significantly resonant.
- <sup>13</sup>  $I(J^P) = 1(3^-)$  from simultaneous analysis of  $p\bar{p} \rightarrow \pi^- \pi^+$  and  $\pi^0 \pi^0$ .
- <sup>14</sup>  $I = 0, 1$ .  $J^P = 3^-$  from Barrelet-zero analysis.
- <sup>15</sup>  $I(J^P) = 1(3^-)$  from amplitude analysis.

• • • We do not use the following data for averages, fits, limits, etc. • • •

|          |       |    |      |   |                                    |
|----------|-------|----|------|---|------------------------------------|
| 2307 ± 6 | ALPER | 80 | CNTR | 0 | 62 $\pi^- p \rightarrow K^+ K^- n$ |
|----------|-------|----|------|---|------------------------------------|

<sup>1</sup>  $I(J^P) = 1(5^-)$  from simultaneous analysis of  $p\bar{p} \rightarrow \pi^- \pi^+$  and  $\pi^0 \pi^0$ .

<sup>2</sup>  $I = 0(1); J^P = 5^-$  from Barrelet-zero analysis.

<sup>3</sup>  $I(J^P) = 1(5^-)$  from amplitude analysis.

<sup>4</sup> From the combined analysis of ANISOVICH 00J, ANISOVICH 01D, ANISOVICH 01E, and ANISOVICH 02.

<sup>5</sup> Isospins 0 and 1 not separated.

<sup>6</sup> From a fit to the total elastic cross section.

<sup>7</sup> Referred to as  $U$  or  $U$  region by ALSPECTOR 73.

<sup>8</sup> For  $I = 1 \bar{N}N$ .

<sup>9</sup> No evidence for this bump seen in the  $\bar{p}p$  data of CHAPMAN 71B. Narrow state not confirmed by OH 73 with more data.

- <sup>1</sup> Extracted employing  $\pi K$  partial wave analysis from ESTABROOKS 78 and ASTON 88, Roy-Steiner equations and once subtracted forward dispersion relations.
- <sup>2</sup> Reanalysis of ESTABROOKS 78 and ASTON 88 satisfying Forward Dispersion Relations and using sequences of Pade approximants.
- <sup>3</sup> Extracted from Breit-Wigner parameters.
- <sup>4</sup> Fit to scattering phase shifts using UChPT amplitudes with explicit resonances.
- <sup>5</sup> Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06C, AITALA 06, and LINK 09 using an  $s$ -dependent width with couplings to  $K\pi$  and  $K\eta'$ , and the Adler zero near thresholds.
- <sup>6</sup> From a complex pole included in the fit. Using parameters from the model that fits data best.
- <sup>7</sup> Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06C using for the  $\kappa$  an  $s$ -dependent width with an Adler zero near threshold.
- <sup>8</sup> Using Roy-Steiner equations (ROY 71) consistent with unitarity, analyticity and crossing symmetry constraints.
- <sup>9</sup> From UChPT fitted to MERCER 71, BINGHAM 72 and ESTABROOKS 78. Amplitude shown to be consistent with data of ABLIKIM 06C.
- <sup>10</sup> Reanalysis of ASTON 88 data.
- <sup>11</sup> Reanalysis of ASTON 88 using interfering Breit-Wigner amplitudes. Extracted from Breit-Wigner parameters.
- <sup>12</sup> Unitarized Quark Model.

**$K^*(892)$  MASSES AND MASS DIFFERENCES**

NODE=M018209

Unrealistically small errors have been reported by some experiments. We use simple “realistic” tests for the minimum errors on the determination of a mass and width from a sample of  $N$  events:

$$\delta_{\min}(m) = \frac{\Gamma}{\sqrt{N}}, \quad \delta_{\min}(\Gamma) = 4 \frac{\Gamma}{\sqrt{N}} . \tag{1}$$

We consistently increase unrealistic errors before averaging. For a detailed discussion, see the 1971 edition of this Note.

CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 14 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 10.7$  for 12 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

<sup>1</sup> Well described in the chiral unitary approach of GENG 07 with two poles at 1195 and 1284 MeV and widths of 246 and 146 MeV, respectively.

<sup>2</sup> From a unitarized quark-model calculation.

<sup>3</sup> From a model-dependent fit with Gaussian background to BRANDENBURG 76 data.

 $63 K^- p \rightarrow K^- 2\pi p$ <sup>1</sup> Average from low and high  $t$  data.<sup>2</sup> Assuming that decays are saturated by the  $K\rho$ ,  $K_0^*(1430)\pi$ ,  $K^*(892)\pi$ ,  $K\omega$  decay modes and neglecting interference between them. The values  $B(\omega \rightarrow \pi^+\pi^-) = (1.53^{+0.11}_{-0.13})\%$  and  $B(K_0^*(1430) \rightarrow K\pi) = (93 \pm 10)\%$  are used. Systematic uncertainties not estimated.NODE=M028R;LINKAGE=F

<sup>1</sup> Using both  $\eta \rightarrow \gamma\gamma$  and  $\eta \rightarrow \pi^+ \pi^- \pi^0$ . From a likelihood scan in the presence of several interfering scalar-meson resonances with fixed width  $\Gamma(K_0^*(1430)) = 210$  MeV.

<sup>2</sup> S-Matrix pole. Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06C, AITALA 06, and LINK 09 using an s-dependent width with couplings to  $K\pi$  and  $K\eta'$ , and the Adler zero near thresholds.

<sup>3</sup> From the isobar model with a complex pole for the  $\kappa$ .

<sup>4</sup> From a non-parametric analysis.

<sup>5</sup> A Breit-Wigner mass and width.

<sup>6</sup> S-matrix pole. Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06C including the  $\kappa$  with an s-dependent width and an Adler zero near threshold.

<sup>7</sup> S-matrix pole. Using ASTON 88 and assuming  $K_0^*(700)$ ,  $K_0^*(1950)$ .

<sup>8</sup> Using ASTON 88 and assuming  $K_0^*(700)$ .

<sup>9</sup> T-matrix pole. Reanalysis of ASTON 88 data.

<sup>10</sup> Breit-Wigner fit. Using ASTON 88.

<sup>11</sup> Assuming a low-mass scalar  $K\pi$  resonance,  $\kappa(700)$ .

<sup>12</sup> T-matrix pole. Using data from ESTABROOKS 78 and ASTON 88.

<sup>13</sup>  $J^P$  not determined, could be  $K_2^*(1430)$ .

<sup>14</sup> T-matrix pole.

<sup>15</sup> Uses a model for the background, without this background they get a mass 1340 MeV, where the phase shift passes  $90^\circ$ .

<sup>16</sup> Mass defined by pole position. From elastic  $K\pi$  partial-wave analysis.

### CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 10 branching ratios uses 32 measurements and one constraint to determine 8 parameters. The overall fit has a  $\chi^2 = 21.1$  for 25 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

## CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 4 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 2.9$  for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

|       |       |       |
|-------|-------|-------|
| $x_2$ | −36   |       |
| $x_3$ | −39   | −72   |
|       | $x_1$ | $x_2$ |

NODE=M095R02  
NODE=M095R02

<sup>4</sup> CHEN 20A quotes the ratio  $\Gamma(K^*(1680)^- \rightarrow K^- \eta) / \Gamma(K^*(1680)^- \rightarrow K^- \pi^0) = 0.11 \pm 0.02^{+0.06}_{-0.04} \pm 0.04(\text{BPDG})$  where the last uncertainty comes from  $B(\eta \rightarrow \gamma\gamma) = (39.41 \pm 0.20)\%$ . We divide it by 3 taking into account that  $\Gamma(K^*(1680)^- \rightarrow K^- \pi^0) / \Gamma(K^*(1680)^- \rightarrow (K\pi)^-) = 1/3$ .

<sup>1</sup> Seen in  $\psi(2S)$  decay with branching ratio  $\psi(2S) \rightarrow K^\pm X \rightarrow K^+ K^- \eta = (2.0 \pm 0.4^{+1.9}_{-0.4}) \times 10^{-6}$ .

<sup>2</sup> From energy-independent partial-wave analysis.

<sup>3</sup> From a fit to  $Y_6^2$  moment.  $J^P = 3^-$  found.

<sup>4</sup> Confirmed by phase shift analysis of ESTABROOKS 78, yields  $J^P = 3^-$ .

<sup>5</sup> From a partial wave amplitude analysis.

<sup>6</sup> From a fit to the  $Y_6^0$  moment.

**CONSTRAINED FIT INFORMATION**

An overall fit to 3 branching ratios uses 4 measurements and one constraint to determine 4 parameters. The overall fit has a  $\chi^2 = 0.0$  for 1 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

NODE=M129

## OMITTED FROM SUMMARY TABLE

Narrow peak observed in several ( $\Lambda\bar{p}$  + pions) and ( $\bar{\Lambda}p$  + pions) states in  $\Sigma^-$  Be reactions by BOURQUIN 86 and in  $np$  and  $nA$  reactions by ALEEV 93. Not seen by BOEHNLEIN 91. If due to strong decays, this state has exotic quantum numbers ( $B=0, Q=+1, S=-1$  for  $\Lambda\bar{p}\pi^+\pi^+$  and  $I \geq 3/2$  for  $\Lambda\bar{p}\pi^-\pi^-$ ). Needs confirmation.

NODE=M061DM

<sup>2</sup> Obtained by analyzing CLEO-c data but not authored by the CLEO Collaboration . This value comes from the average of the results for two decay modes,  $D^0 \rightarrow K^- \pi^+$  and  $D^0 \rightarrow K^- \pi^+ \pi^- \pi^+$ .

<sup>3</sup> From simultaneous fit to  $D^*(2010)^+$ ,  $D^*(2007)^0$ ,  $D^+$ , and  $D^0$ .

| <b>&lt;2.1</b> | 90  | <sup>4</sup> ABACHI | 88B HRS | $D^{*0} \rightarrow D^+ \pi^-$ |

<sup>4</sup> Assuming  $m_{D^{*0}} = 2007.2 \pm 2.1 \text{ MeV}/c^2$ .

### $D^*(2007)^0$ DECAY MODES

$\bar{D}^*(2007)^0$  modes are charge conjugates of modes below.

| Mode                        | Fraction ( $\Gamma_i/\Gamma$ ) |
|-----------------------------|--------------------------------|
| $\Gamma_1 \quad D^0 \pi^0$  | $(64.7 \pm 0.9) \%$            |
| $\Gamma_2 \quad D^0 \gamma$ | $(35.3 \pm 0.9) \%$            |

### CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 5 measurements and one constraint to determine 2 parameters. The overall fit has a  $\chi^2 = 2.5$  for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$$\begin{array}{c|c} x_2 & -100 \\ \hline & x_1 \end{array}$$

### $D^*(2007)^0$ BRANCHING RATIOS

## CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 6 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 0.3$  for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

|       |       |       |

<sup>7</sup> The branching ratios are not independent, they have been constrained by the authors to sum to 100%.

<sup>8</sup> Systematic error includes theoretical error on the prediction of the ratio of hadronic modes.

<sup>9</sup> Assuming that isospin is conserved in the decay.

<sup>10</sup> Not independent of  $\Gamma(D^0 \pi^+) / \Gamma_{\text{total}}$  and  $\Gamma(D^+ \pi^0) / \Gamma_{\text{total}}$  measurement.

<sup>1</sup> From a full four-body amplitude analysis of the  $B^- \rightarrow D^{*+} \pi^- \pi^-$  decay.<sup>2</sup> From the combined fit of the  $M(D^+ \pi^-)$  and  $M(D^{*+} \pi^-)$  distributions. and  $A_{D_2}$  fixed to the theoretical prediction of  $-1$ .<sup>3</sup> Fit includes the contribution from  $D_1^*(2430)^0$ .<sup>4</sup> Calculated using the mass difference  $m(D_1^0) - m(D^{*+})_{PDG}$  reported below and  $m(D^{*+})_{PDG} = 2010.27 \pm 0.17$  MeV. The 0.17 MeV uncertainty of the PDG mass value should be added to the experimental uncertainty of 0.9 MeV.<sup>5</sup> No systematic error given.

### $D_1(2420)^0$ POLARIZATION AMPLITUDE $A_{D_1}$

NODE=M097PAH

A polarization amplitude  $A_{D_1}$  is a parameter that depends on the initial polarization of the  $D_1$  and is sensitive to a possible S-wave contribution to its decay. For  $D_1$  decays the helicity angle,  $\theta_h$ , distribution varies like  $1 + A_{D_1} \cos^2 \theta_h$ , where  $\theta_h$  is the angle in the  $D^*$  rest frame between the two pions emitted by the  $D_1 \rightarrow D^* \pi$  and the  $D^* \rightarrow D \pi$ .

NODE=M097PAH

Unpolarized  $D_1$  decaying purely via  $D$ -wave is predicted to give  $A_{D_1} = 3$ .

 NODE=M120R2

 $D_1(2420)^\pm$  POLARIZATION AMPLITUDE  $A_{D_1}$ 

NODE=M120PAH

A polarization amplitude  $A_{D_1}$  is a parameter that depends on the initial polarization of the  $D_1$  and is sensitive to a possible  $S$ -wave contribution to its decay. For  $D_1$  decays the helicity angle,  $\theta_h$ , distribution varies like  $1 + A_{D_1} \cos^2 \theta_h$ , where  $\theta_h$  is the angle in the  $D^*$  rest frame between the two pions emitted by the  $D_1 \rightarrow D^*\pi$  and the  $D^* \rightarrow D\pi$ .

NODE=M120PAH

Unpolarized  $D_1$  decaying purely via  $D$ -wave is predicted to give  $A_{D_1} = 3$ .

| VALUE                                                                                                                                                                                                                               | DOCUMENT ID         | TECN     | COMMENT                                 |

<sup>1</sup> From the amplitude analysis in the model describing the  $D^+ \pi^-$  wave together with virtual contributions from the  $D^*(2007)^0$  and  $B^{*0}$  states, and components corresponding to the  $D_2^*(2460)^0$ ,  $D_1^*(2680)^0$ ,  $D_3^*(2760)^0$ , and  $D_2^*(3000)^0$  resonances.

<sup>2</sup> From the amplitude analysis in the model describing the  $D^+ \pi^-$  wave together with virtual contributions from the  $D^*(2007)^0$  and  $B^{*0}$  states, nonresonant spin-0 and spin-1 components as well as the  $D_0^*(2400)^0$ ,  $D_2^*(2460)^0$  and  $D_1^*(2760)^0$  resonances.

<sup>3</sup> From the combined fit of the  $M(D^+ \pi^-)$  and  $M(D^{*+} \pi^-)$  distributions. and  $A_{D_2}$  fixed to the theoretical prediction of  $-1$ .

<sup>4</sup> Fit includes the contribution from  $D_0^*(2400)^0$ .

<sup>5</sup> Calculated using the mass difference  $m(D_2^{*0}) - m(D^{*+})_{PDG}$  reported below and  $m(D^{*+})_{PDG} = 2010.27 \pm 0.17$  MeV. The 0.17 MeV uncertainty of the PDG mass value should be added to the experimental uncertainty of  $^{+1.2}_{-1.3}$  MeV.

<sup>6</sup> No systematic error given.

### $m_{D_2^{*0}} - m_{D^+}$

The fit includes  $D^\pm$ ,  $D^0$ ,  $D_s^\pm$ ,  $D^{*\pm}$ ,  $D^{*0}$ ,  $D_s^{*\pm}$ ,  $D_1(2420)^0$ ,  $D_2^*(2460)^0$ , and  $D_{s1}(2536)^\pm$  mass and mass difference measurements.

12 Assuming  $\Gamma(\Upsilon(4S) \rightarrow B^+B^-) / \Gamma(\Upsilon(4S) \rightarrow B^0\bar{B}^0) = 1.065 \pm 0.026$  and equal partial widths for charged and neutral  $D_2^*$  mesons.

NODE=M119R01;LINKAGE=AU

 $D_2^*(2460)^0$  POLARIZATION AMPLITUDE  $A_{D_2}$ 

NODE=M119PAM

A polarization amplitude  $A_{D_2}$  is a parameter that depends on the initial polarization of the  $D_2$ . For  $D_2$  decays the helicity angle,  $\theta_H$ , distribution varies like  $1 + A_{D_2} \cos^2(\theta_H)$ , where  $\theta_H$  is the angle in the  $D^*$  rest frame between the two pions emitted by the  $D_2 \rightarrow D^*\pi$  and  $D^* \rightarrow D\pi$ .

**$D_0(2550)^0$  POLARIZATION AMPLITUDE  $A_{D_J}$**

A polarization amplitude  $A_{D_J}$  is a parameter that depends on the initial polarization of the  $D_J$ . For  $D_J$  decays the helicity angle,  $\theta_H$ , distribution varies like  $1 + A_{D_J} \cos^2(\theta_H)$ , where  $\theta_H$  is the angle in the  $D_J$  rest frame between the two pions emitted in the  $D_J \rightarrow D^*\pi$  and  $D^* \rightarrow D\pi$  decays.

 **$D_2(2740)^0$  POLARIZATION AMPLITUDE  $A_{D_J}$** 

A polarization amplitude  $A_{D_J}$  is a parameter that depends on the initial polarization of the  $D_J$ . For  $D_J$  decays the helicity angle,  $\theta_H$ , distribution varies like  $1 + A_{D_J} \cos^2(\theta_H)$ , where  $\theta_H$  is the angle in the  $D_J$  rest frame between the two pions emitted in the  $D_J \rightarrow D^* \pi$  and  $D^* \rightarrow D \pi$  decays.

### $D_3^*(2750)$ POLARIZATION AMPLITUDE $A_D$

A polarization amplitude  $A_D$  is a parameter that depends on the initial polarization of the  $D_3^*(2750)$ . For  $D_3^*(2750)$  decays the helicity angle,  $\theta_H$ , distribution varies like  $1 + A_D \cos(\theta_H)$ , where  $\theta_H$  is the angle in the  $D^*$  rest frame between the two pions emitted by the  $D_3^*(2750) \rightarrow D^*\pi$  and  $D^* \rightarrow D\pi$ .

NODE=M229PAM

A polarization amplitude  $A_{D_J}$  is a parameter that depends on the initial polarization of the  $D_J$ . For  $D_J$  decays the helicity angle,  $\theta_H$ , distribution varies like  $1 + A_{D_J} \cos^2(\theta_H)$ , where  $\theta_H$  is the angle in the  $D_J$  rest frame between the two pions emitted in the  $D_J \rightarrow D^* \pi$  and  $D^* \rightarrow D \pi$  decays.

## CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 3 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 0.0$  for 1 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

|       |       |       |
|-------|-------|-------|
| $x_2$ | −97   |       |
| $x_3$ | −19   | −4    |
|       | $x_1$ | $x_2$ |

OCCUR=2

<sup>1</sup> From a fit of the  $D_s^*$  recoil mass where the  $D_{s0}^*(2317)$  signal is described with a Crystal Ball function convolved with a Gaussian function.

<sup>2</sup> Supersedes AUBERT 03G.

<sup>3</sup> Systematic errors not evaluated.

<sup>4</sup> Not independent of the corresponding  $m_{D_{s0}^*(2317)} - m_{D_s^*}$ .

<sup>5</sup> From  $D_s^+ \rightarrow K^+ K^- \pi^+$  decay.

<sup>6</sup> From  $D_s^+ \rightarrow K^+ K^- \pi^+ \pi^0$  decay.

### CONSTRAINED FIT INFORMATION

An overall fit to 7 branching ratios uses 8 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 3.4$  for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

|       |       |       |       |
|-------|-------|-------|-------|
| $x_2$ | 80    |       |       |
| $x_3$ | 68    | 62    |       |
| $x_5$ | -3    | 25    | 26    |
|       | $x_1$ | $x_2$ | $x_3$ |

**$D_{s1}(2536)^\pm$**  $I(J^P) = 0(1^+)$   
 $J, P$  need confirmation.Seen in  $D^*(2010)^+ K^0$ ,  $D^*(2007)^0 K^+$ , and  $D_s^+ \pi^+ \pi^-$ . Not seen in  $D^+ K^0$  or  $D^0 K^+$ .  $J^P = 1^+$  assignment strongly favored.

$D_{s2}^*(2573)$

$$I(J^P) = 0(2^+)$$

$J^P$  is natural, width and decay modes consistent with  $2^+$ .  
AAIJ 14AW confirms  $J^P = 2^+$ .

<sup>1</sup> Separated from the spin-3 component  $D_{s3}^*(2860)^-$  by a fit of the helicity angle of the  $\bar{D}^0 K^-$  system, with a statistical significance of the spin-3 and spin-1 components in excess of  $10\sigma$ .

<sup>2</sup> From the combined fit of the  $D^+ K_S^0$  and  $D^0 K^+$  modes in the model including the  $D_{s2}^*(2573)^+$ ,  $D_{s1}^*(2700)^+$  and spin-0  $D_{sJ}^*(2860)^+$ .

<sup>3</sup> Possible contribution from the  $D_{s3}^*(2860)$  state.

<sup>4</sup> From simultaneous fits to the two  $DK$  mass spectra and to the total  $D^*K$  mass spectrum.

<sup>5</sup> Superseded by AUBERT 09AR.

NODE=M151M

• • • We do not use the following data for averages, fits, limits, etc. • • •

<sup>1</sup> AFFOLDER 01F uses the reconstructed  $B$  meson through semileptonic decay channels. The fraction of light  $B$  mesons that are produced at  $L=1$   $B^{**}$  states is measured to be  $0.28 \pm 0.06 \pm 0.03$ .

NODE=M151M;LINKAGE=MF

<sup>2</sup> BARATE 98L uses fully reconstructed  $B$  mesons to search for  $B^{**}$  production in the  $B\pi^\pm$  system. In the framework of heavy quark symmetry (HQS), they also measured the mass of  $B_2^*$  to be  $5739^{+8}_{-11} \pm 6_{-4}$  MeV/ $c^2$  and the relative production rate of  $B(b \rightarrow B_2^* \rightarrow B^{(*)} \pi)/B(b \rightarrow B_{u,d}) = (31 \pm 9^{+6}_{-5})\%$ .

NODE=M151M;LINKAGE=B

<sup>3</sup> Using  $m_{B\pi} - m_B = 424 \pm 4 \pm 10$  MeV.

NODE=M151M;LINKAGE=A

<sup>4</sup> ACCIARRI 99N uses inclusive reconstructed  $B$  mesons to search for  $B^{**}$  production in the  $B^{(*)}\pi^\pm$  system. In the framework of HQET, they measured the mass of  $B_1^*$  and  $B_2^*$  to be  $5670 \pm 10 \pm 13$  MeV and  $5768 \pm 5 \pm 6$  with the  $B(b \rightarrow B^{**}) = (32 \pm 3 \pm 6) \times 10^{-2}$ . They also reported the evidence for the existence of an excited  $B$ -meson state or mixture of states in the region 5.9–6.0 GeV.

# BOTTOM, STRANGE MESONS

## $(B = \pm 1, S = \mp 1)$

$$B_s^0 = s\bar{b}, \bar{B}_s^0 = \bar{s}b, \quad \text{similarly for } B_s^{*\prime}s$$

### X(5568) $^\pm$

$$I(J^P) = ?(??)$$

OMITTED FROM SUMMARY TABLE

Seen as a peak in the  $B_s\pi^\pm$  mass spectrum with a significance of more than  $3\sigma$  by ABAZOV 16E and ABAZOV 18A in inclusive  $p\bar{p}$  collisions at 1.96 TeV. Not seen by AAIJ 16AI, AABOUD 18L, AALTONEN 18A, and SIRUNYAN 18J. Needs confirmation.

<sup>1</sup> With  $B_s$  mesons reconstructed in decays to  $D_s^\pm\mu^\mp X$ .

<sup>2</sup> Seen in  $p\bar{p}$  collisions at 1.96 TeV at a rate of  $(8.6 \pm 1.9 \pm 1.4)\%$  relative to inclusive  $B_s$  production in the kinematic region  $10 < p_T(B_s) < 30$  GeV/c, with  $B_s$  mesons reconstructed in decays to  $J/\psi\phi$ . An alternative possibility,  $X(5568)^\pm \rightarrow B_s^*\pi^\pm$  with a missing  $\gamma$ , could not be ruled out.

<sup>1</sup> AAIJ 19Y observed  $B_c(2S)^+$  in the decay mode  $B_c(2S)^+ \rightarrow B_c^+ \pi^+ \pi^-$  ( $B_c^+ \rightarrow J/\psi \pi^+$ ) with 2.2 (3.2) global (local) standard deviations significance.

<sup>2</sup> AAIJ 19Y reports mass difference measurement of  $M(B_c(2S)^+) - M(B_c^+) = 597.2 \pm 1.3 \pm 0.1$  MeV. We have adjusted this measurement with our best value of  $M(B_c^+) = 6274.47 \pm 0.32$  MeV. The first uncertainty of the  $M(B_c(2S)^+)$  value is a total of uncertainties reported by the experiment and the second one comes from our best value of  $M(B_c^+)$ .

<sup>3</sup> SIRUNYAN 19M observed  $B_c(2S)^+$  in the decay mode  $B_c(2S)^+ \rightarrow B_c^+ \pi^+ \pi^-$  ( $B_c^+ \rightarrow J/\psi \pi^+$ ) with 6.5 standard deviations significance.

<sup>4</sup> SIRUNYAN 19M reports mass difference measurement of  $M(B_c(2S)^+) - M(B_c^+) = 596.1 \pm 1.2 \pm 0.8$  MeV. We have adjusted this measurement with our best value of  $M(B_c^+) = 6274.47 \pm 0.32$  MeV. The first uncertainty of the  $M(B_c(2S)^+)$  value is a total of uncertainties reported by the experiment and the second one comes from our best value of  $M(B_c^+)$ .

<sup>5</sup> AAIJ 18AL reports an upper limit on the ratio of production cross sections for  $[\sigma(B_c(2S)^+)/\sigma(B_c^+)] \cdot B(B_c(2S)^+ \rightarrow B_c^+ \pi^+ \pi^-) < 0.04-0.09$  at 95% CL for the mass value reported by AAD 14AQ.

## Spectroscopy of Mesons Containing Two Heavy Quarks

NODE=MXXX025

NODE=M826

Updated August 2019.

The level scheme of meson states containing a minimal quark content of  $c\bar{c}$ . The name of a state is determined by its quantum numbers  $I^G J^{PC}$  (see the review “Naming Scheme for Hadrons”). States with unestablished quantum numbers are called  $X$  and are drawn according to our best estimate of their likely  $J^{PC}$ . States included in the Summary Tables are shown with solid lines; selected states not in the Summary Tables, but with assigned quantum numbers, are shown with dotted lines. The arrows indicate the most dominant hadronic transitions. Single photon transitions, including  $\psi(nS) \rightarrow \gamma\eta_c(mS)$ ,  $\psi(nS) \rightarrow \gamma\chi_{cJ}(1P)$ , and  $\chi_{cJ}(1P) \rightarrow \gamma J/\psi$ , are omitted for clarity. For orientation, the location of the thresholds related to a pair of ground state open charm mesons is indicated in the figure.

<sup>1</sup> AAIJ 20H report  $m_{J/\psi} - m_{\eta_c(1S)} = 113.0 \pm 0.7 \pm 0.1$  MeV. We use the current value  $m_{J/\psi} = 3096.900 \pm 0.006$  MeV to obtain the quoted mass.

NODE=M026M;LINKAGE=H

<sup>2</sup> AAIJ 17AD report  $m_{J/\psi} - m_{\eta_c(1S)} = 110.2 \pm 0.5 \pm 0.9$  MeV. We use the current value  $m_{J/\psi} = 3096.900 \pm 0.006$  MeV to obtain the quoted mass.

NODE=M026M;LINKAGE=F

<sup>3</sup> From a fit of the  $\phi\phi$  invariant mass with the mass and width of  $\eta_c(1S)$  as free parameters.

NODE=M026M;LINKAGE=G

<sup>4</sup> AAIJ 15BI reports  $m_{J/\psi} - m_{\eta_c(1S)} = 114.7 \pm 1.5 \pm 0.1$  MeV from a sample of  $\eta_c(1S)$  and  $J/\psi$  produced in  $b$ -hadron decays. We have used current value of  $m_{J/\psi} = 3096.900 \pm 0.006$  MeV to arrive at the quoted  $m_{\eta_c(1S)}$  result.

NODE=M026M;LINKAGE=D

<sup>5</sup> Taking into account an asymmetric photon lineshape.

NODE=M026M;LINKAGE=E

<sup>6</sup> With floating width.

NODE=M026M;LINKAGE=AL

<sup>7</sup> Ignoring possible interference with the non-resonant  $0^-$  amplitude.

NODE=M026M;LINKAGE=LS

<sup>8</sup> Using both,  $\eta \rightarrow \gamma\gamma$  and  $\eta \rightarrow \pi^+\pi^-\pi^0$  decays.

NODE=M026M;LINKAGE=EL

<sup>9</sup> From a simultaneous fit to six decay modes of the  $\eta_c$ .

NODE=M026M;LINKAGE=BL

<sup>10</sup> Accounts for interference with non-resonant continuum.

NODE=M026M;LINKAGE=VA

<sup>11</sup> Taking into account interference with the non-resonant  $J^P = 0^-$  amplitude.

NODE=M026M;LINKAGE=LE

<sup>12</sup> From a fit of the  $J/\psi$  recoil mass spectrum. Supersedes ABE,K 02 and ABE 04G.

NODE=M026M;LINKAGE=EB

<sup>13</sup> Using mass of  $\psi(2S) = 3686.00$  MeV.

NODE=M026M;LINKAGE=BG

<sup>14</sup> Not independent from the measurements reported by LEES 10.

NODE=M026M;LINKAGE=DE

<sup>15</sup> MITCHELL 09 observes a significant asymmetry in the lineshapes of  $\psi(2S) \rightarrow \gamma\eta_c$  and  $J/\psi \rightarrow \gamma\eta_c$  transitions. If ignored, this asymmetry could lead to significant bias whenever the mass and width are measured in  $\psi(2S)$  or  $J/\psi$  radiative decays.

NODE=M026M;LINKAGE=MI

<sup>16</sup> From the fit of the kaon momentum spectrum. Systematic errors not evaluated.

NODE=M026M;LINKAGE=AU

<sup>17</sup> Superseded by LEES 10.

NODE=M026M;LINKAGE=UB

<sup>18</sup> From a simultaneous fit of five decay modes of the  $\eta_c$ .

NODE=M026M;LINKAGE=AK

<sup>19</sup> Superseded by VINOKUROVA 11.

NODE=M026M;LINKAGE=FA

<sup>20</sup> Weighted average of the  $\psi(2S)$  and  $J/\psi(1S)$  samples. Using an  $\eta_c$  width of 13.2 MeV.

NODE=M026M;LINKAGE=KZ

<sup>21</sup> Average of several decay modes. Using an  $\eta_c$  width of 13.2 MeV.

NODE=M026M;LINKAGE=C1

<sup>22</sup> Superseded by ASNER 04.

NODE=M026M;LINKAGE=NN

## CONSTRAINED FIT INFORMATION

An overall fit to the total width, 8 combinations of partial widths obtained from integrated cross section, and 19 branching ratios uses 93 measurements and one constraint to determine 13 parameters. The overall fit has a  $\chi^2 = 117.8$  for 81 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

<sup>1</sup> From the corrected and unfolded mass spectrum.

<sup>2</sup> Calculated by us from the value reported in ASNER 04 that assumes  $B(\eta_c \rightarrow K\bar{K}\pi) = 5.5 \pm 1.7\%$

<sup>3</sup> We have multiplied  $K^\pm K_S^0 \pi^\mp$  measurement by 3 to obtain  $K\bar{K}\pi$ .

<sup>4</sup> Calculated by us from the value reported in ABDALLAH 03J, which uses  $B(\eta_c \rightarrow K_S^0 K^\pm \pi^\mp) = (1.5 \pm 0.4)\%$ .

<sup>5</sup> Not independent from the measurements reported by LEES 10.

<sup>6</sup> Superseded by ASNER 04.

• • • We do not use the following data for averages, fits, limits, etc. • • •

< 10.7 90% CL <sup>8,12</sup> PARTRIDGE 80B CBAL  $J/\psi \rightarrow \eta_c \gamma$

<sup>1</sup> ABLIKIM 19AP quotes  $B(\eta_c \rightarrow K^+ K^- \pi^0) = (1.15 \pm 0.12 \pm 0.10) \times 10^{-2}$  which we multiply by 6 to account for isospin symmetry.

<sup>2</sup> ABLIKIM 19AP quotes  $B(\eta_c \rightarrow K_S^0 K^\pm \pi^\mp) = (2.60 \pm 0.21 \pm 0.20) \times 10^{-2}$  which we multiply by 3 to account for isospin symmetry.

<sup>3</sup> ABLIKIM 12N quotes  $B(\psi(2S) \rightarrow \pi^0 h_c) \cdot B(h_c \rightarrow \gamma \eta_c) \cdot B(\eta_c \rightarrow K^+ K^- \pi^0) = (4.54 \pm 0.76 \pm 0.48) \times 10^{-6}$  which we multiply by 6 to account for isospin symmetry.

<sup>4</sup> ABLIKIM 12N reports  $[\Gamma(\eta_c(1S) \rightarrow K \bar{K} \pi) / \Gamma_{\text{total}}] \times [B(\psi(2S) \rightarrow \pi^0 h_c(1P))] \times [B(h_c(1P) \rightarrow \gamma \eta_c(1S))] = (27.24 \pm 4.56 \pm 2.88) \times 10^{-6}$  which we divide by our best values  $B(\psi(2S) \rightarrow \pi^0 h_c(1P)) = (8.6 \pm 1.3) \times 10^{-4}$ ,  $B(h_c(1P) \rightarrow \gamma \eta_c(1S)) = (50 \pm 9) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.

<sup>5</sup> ABLIKIM 12N quotes  $B(\psi(2S) \rightarrow \pi^0 h_c) \cdot B(h_c \rightarrow \gamma \eta_c) \cdot B(\eta_c \rightarrow K_S^0 K^\pm \pi^\mp) = (11.35 \pm 1.25 \pm 1.50) \times 10^{-6}$  which we multiply by 3 to account for isospin symmetry.

<sup>6</sup> ABLIKIM 12N reports  $[\Gamma(\eta_c(1S) \rightarrow K \bar{K} \pi) / \Gamma_{\text{total}}] \times [B(\psi(2S) \rightarrow \pi^0 h_c(1P))] \times [B(h_c(1P) \rightarrow \gamma \eta_c(1S))] = (34.05 \pm 3.75 \pm 4.50) \times 10^{-6}$  which we divide by our best values  $B(\psi(2S) \rightarrow \pi^0 h_c(1P)) = (8.6 \pm 1.3) \times 10^{-4}$ ,  $B(h_c(1P) \rightarrow \gamma \eta_c(1S)) = (50 \pm 9) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best values.

<sup>7</sup> Determined from the ratio of  $B(B^\pm \rightarrow K^\pm \eta_c) B(\eta_c \rightarrow K \bar{K} \pi) = (7.4 \pm 0.5 \pm 0.7) \times 10^{-5}$  reported in AUBERT, B 04B and  $B(B^\pm \rightarrow K^\pm \eta_c) = (8.7 \pm 1.5) \times 10^{-3}$  reported in AUBERT 06E.

<sup>8</sup> The quoted branching ratios use  $B(J/\psi(1S) \rightarrow \gamma \eta_c(1S)) = 0.0127 \pm 0.0036$ . Where relevant, the error in this branching ratio is treated as a common systematic in computing averages.

<sup>9</sup> Average from  $K^+ K^- \pi^0$  and  $K^\pm K_S^0 \pi^\mp$  decay channels.

<sup>10</sup>  $K^\pm K_S^0 \pi^\mp$  corrected to  $K \bar{K} \pi$  by factor 3. KS, MR.

<sup>11</sup> Estimated using  $B(\psi(2S) \rightarrow \gamma \eta_c(1S)) = 0.0028 \pm 0.0006$ .

<sup>12</sup>  $K^+ K^- \pi^0$  corrected to  $K \bar{K} \pi$  by factor 6. KS, MR

<sup>1</sup> Supersedes AULCHENKO 03.

<sup>2</sup> Reanalysis of ZHOLENTZ 80 using new electron mass (COHEN 87) and radiative corrections (KURAEV 85).

<sup>3</sup> Mass central value and systematic error recalculated by us according to Eq.(16) in ARMSTRONG 93B, using the value for the  $\psi(2S)$  mass from AULCHENKO 03.

<sup>4</sup> From a sample of  $\eta_c(1S)$  and  $J/\psi$  produced in  $b$ -hadron decays. Systematic uncertainties not estimated.

<sup>5</sup> Superseded by ARTAMONOV 00.

<sup>6</sup> From a simultaneous fit to  $e^+e^-$ ,  $\mu^+\mu^-$  and hadronic channels assuming  $\Gamma(e^+e^-) = \Gamma(\mu^+\mu^-)$ .

<sup>1</sup> From the cross sections of  $e^+e^- \rightarrow e^+e^-$  and  $e^+e^- \rightarrow$  hadrons near the  $J/\psi(1S)$  peak.

<sup>2</sup> Based on the same dataset as ANASHIN 20 and correlated to the values reported there.

<sup>3</sup> From a simultaneous fit to  $e^+e^-$ ,  $\mu^+\mu^-$ , and hadronic channels assuming  $\Gamma(e^+e^-) = \Gamma(\mu^+\mu^-)$ .

<sup>4</sup> Using  $B(J/\psi \rightarrow \mu^+\mu^-) = (5.973 \pm 0.007 \pm 0.037)\%$  from ABLIKIM 13R.

<sup>5</sup> Calculated by us from the reported values of  $\Gamma(e^+e^-) \times B(\mu^+\mu^-)$  using  $B(\mu^+\mu^-) = (5.93 \pm 0.06)\%$ .

<sup>6</sup> Assuming equal partial widths for  $e^+e^-$  and  $\mu^+\mu^-$ .

WEIGHTED AVERAGE  
11.9±0.6 (Error scaled by 1.8)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

• • • We do not use the following data for averages, fits, limits, etc. • • •

0.6±0.2±0.1 16 BECKER 87 MRK3  $J/\psi \rightarrow \phi K \bar{K} \pi$ 

<sup>1</sup> ABLIKIM 15H reports  $[\Gamma(J/\psi(1S) \rightarrow \phi f_1(1285))/\Gamma_{\text{total}}] \times [B(f_1(1285) \rightarrow \eta\pi^+\pi^-)] = (1.20 \pm 0.6 \pm 0.14) \times 10^{-4}$  which we divide by our best value  $B(f_1(1285) \rightarrow \eta\pi^+\pi^-) = (35 \pm 15) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>2</sup> We attribute to the  $f_1(1285)$  the signal observed in the  $\pi^+\pi^-\eta$  invariant mass distribution at 1297 MeV.

NODE=M070R7  
NODE=M070R7

OCCUR=2

<sup>1</sup> From  $J/\psi \rightarrow \pi^+\pi^-\pi^0$  events directly.

<sup>2</sup> The quoted systematic error includes a contribution of 1.23% (added in quadrature) from the uncertainty on the number of  $J/\psi$  events.

<sup>3</sup> AUBERT 07AU reports  $[\Gamma(J/\psi(1S) \rightarrow \pi^+\pi^-\pi^0)/\Gamma_{\text{total}}] \times [\Gamma(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \rightarrow e^+e^-)/\Gamma_{\text{total}}] = (18.6 \pm 1.2 \pm 1.1) \times 10^{-3}$  keV which we divide by our best value  $\Gamma(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \rightarrow e^+e^-)/\Gamma_{\text{total}} = 0.808 \pm 0.013$  keV. Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup> Mostly  $\rho\pi$ , see also  $\rho\pi$  subsection.

<sup>5</sup> Obtained comparing the rates for  $\pi^+\pi^-\pi^0$  and  $\mu^+\mu^-$ , using  $J/\psi$  events produced via  $\psi(2S) \rightarrow \pi^+\pi^-J/\psi$  and with  $B(J/\psi \rightarrow \mu^+\mu^-) = 5.88 \pm 0.10\%$ .

<sup>1</sup>LU 19 reports  $(8.32^{+1.63}_{-1.45} \pm 0.49) \times 10^{-4}$  from a measurement of  $[\Gamma(J/\psi(1S) \rightarrow pK^-\bar{\Lambda}+\text{c.c.})/\Gamma_{\text{total}}] \times [B(B^+ \rightarrow J/\psi(1S)K^+)]$  assuming  $B(B^+ \rightarrow J/\psi(1S)K^+) = (1.026 \pm 0.031) \times 10^{-3}$ , which we rescale to our best value  $B(B^+ \rightarrow J/\psi(1S)K^+) = (1.020 \pm 0.019) \times 10^{-3}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>1</sup> MITCHELL 09 reports  $(1.98 \pm 0.09 \pm 0.30) \times 10^{-2}$  from a measurement of  $[\Gamma(J/\psi(1S) \rightarrow \gamma\eta_c(1S))/\Gamma_{\text{total}}] \times [B(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-)]$  assuming  $B(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) = (35.04 \pm 0.07 \pm 0.77) \times 10^{-2}$ , which we rescale to our best value  $B(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) = (34.68 \pm 0.30) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>2</sup> Calculated by the authors using an average of  $B(J/\psi \rightarrow \gamma\eta_c) \times B(\eta_c \rightarrow K\bar{K}\pi)$  from BALTRUSAITIS 86, BISELLO 91, BAI 04 and  $B(\eta_c \rightarrow K\bar{K}\pi) = (8.5 \pm 1.8)\%$  from AUBERT 06E.

<sup>1</sup> Using CLEO-c data but not authored by the CLEO Collaboration.

<sup>2</sup> DOBBS 15 reports  $[\Gamma(J/\psi(15) \rightarrow \gamma f'_2(1525))/\Gamma_{\text{total}}] \times [B(f'_2(1525) \rightarrow K \bar{K})] = (7.09 \pm 0.46 \pm 0.67) \times 10^{-4}$  which we divide by our best value  $B(f'_2(1525) \rightarrow K \bar{K}) = (87.6 \pm 2.2) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>3</sup> Using  $B(f'_2(1525) \rightarrow K \bar{K}) = 0.888$ .

<sup>4</sup> Assuming isotropic production and decay of the  $f'_2(1525)$  and isospin.

<sup>1</sup> From a fit of the measured  $\pi^+\pi^-\eta'$  lineshape that accounts for the abrupt distortion observed at the  $p\bar{p}$  threshold with a Flatte formula in addition to known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner ( $M \approx 1919$  MeV;  $\Gamma \approx 51$  MeV) that is required for a good fit. Another explanation for the distortion provided by ABLIKIM 16J is that a second resonance near 1870 MeV interferes with the  $X(1835)$ ; fits to this possibility yield product branching fraction values compatible with that shown within the respective systematic uncertainties.

<sup>2</sup> From a fit of the  $\pi^+\pi^-\eta'$  mass distribution to a combination of  $\gamma f_1(1510)$ ,  $\gamma X(1835)$ , and two states  $\gamma X(2120)$  and  $\gamma X(2370)$ , for  $M(\pi^+\pi^-\eta') < 2.8$  GeV, and accounting for backgrounds from non- $\eta'$  events and  $J/\psi \rightarrow \pi^0\pi^+\pi^-\eta'$ .

## BRANCHING RATIOS OF $\psi(2S)$ AND $\chi_{c0,1,2}$

Updated March 2020 by J.J. Hernández-Rey (IFIC, Valencia), S. Navas (U. of Granada), and C. Patrignani (Bologna Univ., INFN)

Since 2002, the treatment of the branching ratios of the  $\psi(2S)$  and  $\chi_{c0,1,2}$  has undergone an important restructuring.

When measuring a branching ratio experimentally, it is not always possible to normalize the number of events observed in the corresponding decay mode to the total number of particles produced. Therefore, the experimenters sometimes report the number of observed decays with respect to another decay mode of the same or another particle in the relevant decay chain. This is actually equivalent to measuring combinations of branching fractions of several decay modes.

To extract the branching ratio of a given decay mode, the collaborations use some previously reported measurements of the required branching ratios. However, the values are frequently taken from the *Review of Particle Physics* (RPP), which in turn uses the branching ratio reported by the experiment in the following edition, giving rise either to correlations or to plain vicious circles, as discussed in more detail in earlier editions of this review [1,2].

The way to avoid these dependencies and correlations is to extract the branching ratios through a fit that uses the truly measured combinations of branching fractions and partial widths. This fit, in fact, should involve decays from the four concerned particles,  $\psi(2S)$ ,  $\chi_{c0}$ ,  $\chi_{c1}$ , and  $\chi_{c2}$ , and occasionally some combinations of branching ratios of more than one of them. This is what is done since the 2002 edition [3].

The PDG policy is to quote the results of the collaborations in a manner as close as possible to what appears in their original publications. However, in order to avoid the problems mentioned above, we had in some cases to work out the values originally measured, using the number of events and detection efficiencies given by the collaborations, or rescaling back the published results. The information was sometimes spread over several articles, and some articles referred to papers still unpublished, which in turn contained the relevant numbers in footnotes.

Even though the experimental collaborations are entitled to extract whatever branching ratios they consider appropriate by using other published results, we would like to encourage them to also quote explicitly in their articles the actual quantities

measured, so that they can be used directly in averages and fits of different experimental determinations.

To inform the reader how we computed some of the values used in this edition of RPP, we use footnotes to indicate the branching ratios actually given by the experiments and the quantities they use to derive them from the true combination of branching ratios actually measured.

None of the branching ratios of the  $\chi_{c0,1,2}$  are measured independently of the  $\psi(2S)$  radiative decays. We tried to identify those branching ratios which can be correlated in a non-trivial way, and although we cannot preclude the existence of other cases, we are confident that the most relevant correlations have already been removed. Nevertheless, correlations in the errors of different quantities measured by the same experiment have not been taken into account.

## Fit information

This is an overall fit to 4 total widths, 1 partial width, 26 combinations of partial widths, 24 branching ratios, and 108 combinations of branching ratios. Of the latter 62 involve decays of more than one particle.

The overall fit uses 248 measurements to determine 49 parameters and has a  $\chi^2$  of 378.1 for 199 degrees of freedom.

The relatively high  $\chi^2$  of the fit, 1.9 per d.o.f., can be traced back to a few specific discrepancies in the data. No scaling factors to fit uncertainties have been applied.

In the listing we provide the inter-particle correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the corresponding parameter  $x_i$ .

**CONSTRAINED FIT INFORMATION**

A multiparticle fit to  $\chi_{c1}(1P)$ ,  $\chi_{c0}(1P)$ ,  $\chi_{c2}(1P)$ , and  $\psi(2S)$  with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a  $\chi^2 = 378.1$  for 199 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

 $\psi(2S) \rightarrow \gamma \chi_{c0}$ NODE=M056B19  
NODE=M056B19

<sup>1</sup> The reported value is derived using  $B(\psi(2S) \rightarrow \pi^+ \pi^- J/\psi) \times B(J/\psi \rightarrow \ell^+ \ell^-) = (4.6 \pm 0.7)\%$ . Calculated by us using  $B(J/\psi \rightarrow \ell^+ \ell^-) = 0.1181 \pm 0.0020$ .

NODE=M056B19;LINKAGE=TA

$$\Gamma(\chi_{c0}(1P) \rightarrow K^+ K^- K^+ K^-) / \Gamma_{\text{total}} \times \Gamma(\psi(2S) \rightarrow \gamma \chi_{c0}(1P)) / \Gamma_{\text{total}}$$

$$\Gamma_{51} / \Gamma \times \Gamma_{151}^{\psi(2S)} / \Gamma_{11}^{\psi(2S)}$$

OCCUR=2

<sup>1</sup> From a fit of the  $\phi\phi$  invariant mass with the width of  $\chi_{c1}(1P)$  fixed to the PDG 16 value.

<sup>2</sup> AAIJ 17BI reports also  $m(\chi_{c2}) - m(\chi_{c1}) = 45.39 \pm 0.07 \pm 0.03$  MeV.

<sup>3</sup> Recalculated by ANDREOTTI 05A, using the value of  $\psi(2S)$  mass from AULCHENKO 03.

<sup>4</sup> Using mass of  $\psi(2S) = 3686.0$  MeV.

<sup>5</sup>  $J/\psi(1S)$  mass constrained to 3097 MeV.

<sup>6</sup> Mass value shifted by us by amount appropriate for  $\psi(2S)$  mass = 3686 MeV and  $J/\psi(1S)$  mass = 3097 MeV.

<sup>7</sup> From a simultaneous fit to radiative and hadronic decay channels.

### CONSTRAINED FIT INFORMATION

A multiparticle fit to  $\chi_{c1}(1P)$ ,  $\chi_{c0}(1P)$ ,  $\chi_{c2}(1P)$ , and  $\psi(2S)$  with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a  $\chi^2 = 378.1$  for 199 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

<sup>1</sup>With floating width.

<sup>2</sup>Combination of exclusive and inclusive analyses for the reaction  $\psi(2S) \rightarrow \pi^0 h_c \rightarrow \pi^0 \eta_c \gamma$ . This result is the average of DOBBS 08A and ROSNER 05.

<sup>3</sup>Superseded by DOBBS 08A.

<sup>4</sup>Mass central value and systematic error recalculated by us according to Eq.(16) in ARMSTRONG 93B, using the value for the  $\psi(2S)$  mass from AULCHENKO 03.

<sup>1</sup> ABLIKIM 10B reports  $[\Gamma(h_c(1P) \rightarrow \gamma\eta_c(1S))/\Gamma_{\text{total}}] \times [B(\psi(2S) \rightarrow \pi^0 h_c(1P))]$   $= (4.58 \pm 0.40 \pm 0.50) \times 10^{-4}$  which we divide by our best value  $B(\psi(2S) \rightarrow \pi^0 h_c(1P)) = (8.6 \pm 1.3) \times 10^{-4}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

NODE=M144R2;LINKAGE=A

<sup>2</sup> Average of DOBBS 08A and ROSNER 05. DOBBS 08A reports  $[\Gamma(h_c(1P) \rightarrow \gamma\eta_c(1S))/\Gamma_{\text{total}}] \times [B(\psi(2S) \rightarrow \pi^0 h_c(1P))]$   $= (4.16 \pm 0.30 \pm 0.37) \times 10^{-4}$  which we divide by our best value  $B(\psi(2S) \rightarrow \pi^0 h_c(1P)) = (8.6 \pm 1.3) \times 10^{-4}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

NODE=M144R2;LINKAGE=DB

<sup>3</sup> DOBBS 08A reports  $[\Gamma(h_c(1P) \rightarrow \gamma\eta_c(1S))/\Gamma_{\text{total}}] \times [B(\psi(2S) \rightarrow \pi^0 h_c(1P))]$   $= (4.19 \pm 0.32 \pm 0.45) \times 10^{-4}$  which we divide by our best value  $B(\psi(2S) \rightarrow \pi^0 h_c(1P))$

NODE=M144R2;LINKAGE=DO

$= (8.6 \pm 1.3) \times 10^{-4}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup>ROSNER 05 reports  $[\Gamma(h_c(1P) \rightarrow \gamma \eta_c(1S))/\Gamma_{\text{total}}] \times [B(\psi(2S) \rightarrow \pi^0 h_c(1P))] = (4.0 \pm 0.8 \pm 0.7) \times 10^{-4}$  which we divide by our best value  $B(\psi(2S) \rightarrow \pi^0 h_c(1P)) = (8.6 \pm 1.3) \times 10^{-4}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>1</sup> From a fit of the  $\phi\phi$  invariant mass with the width of  $\chi_{c2}(1P)$  fixed to the PDG 16 value.

<sup>2</sup> AAIJ 17BI reports also  $m(\chi_{c2}) - m(\chi_{c1}) = 45.39 \pm 0.07 \pm 0.03$  MeV.

<sup>3</sup> Recalculated by ANDREOTTI 05A, using the value of  $\psi(2S)$  mass from AULCHENKO 03.

<sup>4</sup> Using mass of  $\psi(2S) = 3686.0$  MeV.

<sup>5</sup>  $J/\psi(1S)$  mass constrained to 3097 MeV.

<sup>6</sup> Assuming  $\psi(2S)$  mass = 3686 MeV and  $J/\psi(1S)$  mass = 3097 MeV.

<sup>7</sup> Mass value shifted by us by amount appropriate for  $\psi(2S)$  mass = 3686 MeV and  $J/\psi(1S)$  mass = 3097 MeV.

<sup>8</sup> From a simultaneous fit to radiative and hadronic decay channels.

## CONSTRAINED FIT INFORMATION

A multiparticle fit to  $\chi_{c1}(1P)$ ,  $\chi_{c0}(1P)$ ,  $\chi_{c2}(1P)$ , and  $\psi(2S)$  with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a  $\chi^2 = 378.1$  for 199 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

 $\psi(2S) \rightarrow \gamma \chi_{c2}$ 

<sup>1</sup> ABLIKIM 17AI reports  $(4.76 \pm 0.56 \pm 0.38) \times 10^{-5}$  from a measurement of  $[\Gamma(\chi_{c2}(1P) \rightarrow \eta' \eta')/\Gamma_{\text{total}}] \times [B(\psi(2S) \rightarrow \gamma \chi_{c2}(1P))]$  assuming  $B(\psi(2S) \rightarrow \gamma \chi_{c2}(1P)) = (9.11 \pm 0.31) \times 10^{-2}$ , which we rescale to our best value  $B(\psi(2S) \rightarrow \gamma \chi_{c2}(1P)) = (9.52 \pm 0.20) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

NODE=M057R04;LINKAGE=A

<sup>2</sup> ASNER 09 reports  $< 1.0 \times 10^{-4}$  from a measurement of  $[\Gamma(\chi_{c2}(1P) \rightarrow \eta' \eta')/\Gamma_{\text{total}}] \times [B(\psi(2S) \rightarrow \gamma \chi_{c2}(1P))]$  assuming  $B(\psi(2S) \rightarrow \gamma \chi_{c2}(1P)) = (9.33 \pm 0.14 \pm 0.61) \times 10^{-2}$ , which we rescale to our best value  $B(\psi(2S) \rightarrow \gamma \chi_{c2}(1P)) = 9.52 \times 10^{-2}$ .

NODE=M057R04;LINKAGE=AS

<sup>3</sup> Superseded by ASNER 09. ADAMS 07 reports  $< 3.1 \times 10^{-4}$  from a measurement of  $[\Gamma(\chi_{c2}(1P) \rightarrow \eta' \eta')/\Gamma_{\text{total}}] \times [B(\psi(2S) \rightarrow \gamma \chi_{c2}(1P))]$  assuming  $B(\psi(2S) \rightarrow \gamma \chi_{c2}(1P)) = 0.0933 \pm 0.0014 \pm 0.0061$ , which we rescale to our best value  $B(\psi(2S) \rightarrow \gamma \chi_{c2}(1P)) = 9.52 \times 10^{-2}$ .
