OCCUR=2

OCCUR=2

<sup>1</sup>AAIJ 17AD report  $m_{\psi(2S)} - m_{\eta_c(2S)} = 52.5 \pm 1.7 \pm 0.6$  MeV. We use the current value  $m_{\psi(2S)} = 3686.097 \pm 0.025$  MeV to obtain the quoted mass.

<sup>2</sup>From a fit of the  $\phi\phi$  invariant mass with the width of  $\eta_c(2S)$  fixed to the PDG 16 value.

<sup>3</sup>Ignoring possible interference with continuum.

<sup>4</sup>With a width fixed to 11.3 MeV.

<sup>5</sup>With a width fixed to 11.3 MeV. Using both  $\eta \rightarrow \gamma\gamma$  and  $\eta \rightarrow \pi^+\pi^-\pi^0$  decays.

<sup>6</sup>From a simultaneous fit to  $K_S^0 K^\pm \pi^\mp$  and  $K^+K^-\pi^0$  decay modes.

<sup>7</sup>Accounts for interference with non-resonant continuum.

<sup>8</sup>From a fit of the  $J/\psi$  recoil mass spectrum. Supersedes ABE,K 02 and ABE 04G.

<sup>9</sup>From the fit of the kaon momentum spectrum. Systematic errors not evaluated.

<sup>10</sup>Superseded by DEL-AMO-SANCHEZ 11M.

<sup>11</sup>Superseded by VINOKUROVA 11.

<sup>12</sup>Assuming mass of  $\psi(2S) = 3686$  MeV.

<sup>20</sup> Assuming that the branching fraction into  $\eta' \pi^+ \pi^-$  is the same as for  $\eta_c(1S)$ .

<sup>21</sup> They measure  $\Gamma(\eta_c(2S) \gamma\gamma) / B(\eta_c(2S) \rightarrow K \bar{K} \pi) = (0.18 \pm 0.05 \pm 0.02) \Gamma(\eta_c(1S) \gamma\gamma) / B(\eta_c(1S) \rightarrow K \bar{K} \pi)$ . The value for  $\Gamma(\eta_c(2S) \rightarrow \gamma\gamma)$  is derived assuming that the branching fractions for  $\eta_c(2S)$  and  $\eta_c(1S)$  decays to  $K_S K \pi$  are equal and using  $\Gamma(\eta_c(1S) \rightarrow \gamma\gamma) = 7.4 \pm 0.4 \pm 2.3$  keV.

<sup>1</sup>Supersedes AULCHENKO 03 and ANASHIN 12.

<sup>2</sup>Reanalysis of ZHOLENTZ 80 using new electron mass (COHEN 87) and radiative corrections (KURAEV 85).

<sup>3</sup>Mass central value and systematic error recalculated by us according to Eq.(16) in ARMSTRONG 93B, using the value for the  $J/\psi(1S)$  mass from AULCHENKO 03.

<sup>4</sup>From the scans in 2004 and 2006. ANASHIN 12 reports the value  $3686.114 \pm 0.007 \pm 0.011^{+0.002}_{-0.012}$  MeV, where the third uncertainty is due to assumptions on the interference between the resonance and hadronic continuum. We combined the two systematic uncertainties.

<sup>5</sup>Superseded by ARTAMONOV 00.

## CONSTRAINED FIT INFORMATION

A multiparticle fit to  $\chi_{c1}(1P)$ ,  $\chi_{c0}(1P)$ ,  $\chi_{c2}(1P)$ , and  $\psi(2S)$  with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a  $\chi^2 = 378.1$  for 199 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ .

NODE=M071230

This combination of a partial width with the partial width into  $e^+e^-$  and with the total width is obtained from the integrated cross section into channel(i) in the  $e^+e^-$  annihilation. We list only data that have not been used to determine the partial width  $\Gamma(i)$  or the branching ratio  $\Gamma(i)/\text{total}$ .

 $\Gamma_{30}/\Gamma$ 

NODE=M071R28  
 NODE=M071R28

<sup>1</sup> Using CLEO-c data but not authored by the CLEO Collaboration.

<sup>2</sup> AUBERT 07BD reports  $[\Gamma(\psi(2S) \rightarrow \Lambda\bar{\Lambda})/\Gamma_{\text{total}}] \times [\Gamma(\psi(2S) \rightarrow e^+e^-)] = (15 \pm 4 \pm 1) \times 10^{-4}$  keV which we divide by our best value  $\Gamma(\psi(2S) \rightarrow e^+e^-) = 2.33 \pm 0.04$  keV. Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>3</sup> Superseded by DOBBS 17.<sup>4</sup> Estimated using  $B(\psi(2S) \rightarrow J/\psi\pi^+\pi^-) = 0.310 \pm 0.028$ .

<sup>1</sup> AUBERT 07AU reports  $[\Gamma(\psi(2S) \rightarrow K^+ K^- \pi^+ \pi^- \pi^0)/\Gamma_{\text{total}}] \times [\Gamma(\psi(2S) \rightarrow e^+ e^-)] = (44 \pm 13 \pm 3) \times 10^{-4}$  keV which we divide by our best value  $\Gamma(\psi(2S) \rightarrow e^+ e^-) = 2.33 \pm 0.04$  keV. Our first error is their experiment's error and our second error is the systematic error from using our best value.

< 20 90 ATHAR 04 CLEO  $e^+e^- \rightarrow \gamma X$

20-130 95 EDWARDS 82C CBAL  $e^+e^- \rightarrow \gamma X$

<sup>1</sup> ABLIKIM 12G reports  $[\Gamma(\psi(2S) \rightarrow \gamma\eta_c(2S))/\Gamma_{\text{total}}] \times [B(\eta_c(2S) \rightarrow K \bar{K} \pi)] = (1.30 \pm 0.20 \pm 0.30) \times 10^{-5}$  which we divide by our best value  $B(\eta_c(2S) \rightarrow K \bar{K} \pi) = (1.9 \pm 1.2) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>2</sup> CRONIN-HENNESSY 10 reports  $[\Gamma(\psi(2S) \rightarrow \gamma\eta_c(2S))/\Gamma_{\text{total}}] \times [B(\eta_c(2S) \rightarrow K \bar{K} \pi)] < 14.5 \times 10^{-6}$  which we divide by our best value  $B(\eta_c(2S) \rightarrow K \bar{K} \pi) = 1.9 \times 10^{-2}$ . This measurement assumes  $\Gamma(\eta_c(2S)) = 14$  MeV. CRONIN-HENNESSY 10 gives the analytic dependence of limits on width.

3778.4±3.0±1.3 34 CHISTOV 04 BELL Sup. by BRODZICKA 08

<sup>1</sup> Measured in prompt hadroproduction.<sup>2</sup> Taking into account interference between the resonant and non-resonant  $D\bar{D}$  production.<sup>3</sup> From the joint analysis of the data on the  $D\bar{D}$  and inclusive hadronic cross sections in the  $\psi(3770)$  region from BaBar, Belle, BES-II, CLEO and KEDR.<sup>4</sup> Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the  $\psi(3770)$ ,  $\psi(4040)$ ,  $\psi(4160)$ , and  $\psi(4415)$  resonances. Phase angle fixed in the fit to  $\delta = 0^\circ$ .<sup>5</sup> Interference between the resonant and non-resonant  $D\bar{D}$  production not taken into account.

NODE=M053W

- <sup>1</sup> Taking into account interference between the resonant and non-resonant  $D\bar{D}$  production.
- <sup>2</sup> Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the  $\psi(3770)$ ,  $\psi(4040)$ ,  $\psi(4160)$ , and  $\psi(4415)$  resonances. Phase angle fixed in the fit to  $\delta = 0^\circ$ .
- <sup>3</sup> Interference between the resonant and non-resonant  $D\bar{D}$  production not taken into account.
- <sup>4</sup> From the joint analysis of the data on the  $D\bar{D}$  and inclusive hadronic cross sections in the  $\psi(3770)$  region from BaBar, Belle, BES-II, CLEO and KEDR.

### $\psi(3770)$ DECAY MODES

NODE=M053220;NODE=M053

In addition to the dominant decay mode to  $D\bar{D}$ ,  $\psi(3770)$  was found to decay into the final states containing the  $J/\psi$  (BAI 05, ADAM 06). ADAMS 06 and HUANG 06A searched for various decay modes with light hadrons and found a statistically significant signal for the decay to  $\phi\eta$  only (ADAMS 06).

#### CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 3 branching ratios uses 23 measurements and one constraint to determine 5 parameters. The overall fit has a  $\chi^2 = 20.1$  for 19 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$ , in percent, from the fit to parameters  $p_i$ , including the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

2.9 ± 0.5 ± 0.4 <sup>3</sup> BRIERE 06 CLEO  $e^+ e^- \rightarrow \psi(3770) \rightarrow \gamma + \text{hadrons}, \gamma\gamma J/\psi$

• • • We do not use the following data for averages, fits, limits, etc. • • •

3.9 ± 1.4 ± 0.6 54 <sup>4</sup> BRIERE 06 CLEO  $e^+ e^- \rightarrow \psi(3770) \rightarrow \gamma + \text{hadrons}$

2.8 ± 0.5 ± 0.4 53 <sup>5</sup> COAN 06A CLEO  $e^+ e^- \rightarrow \psi(3770) \rightarrow \gamma\gamma J/\psi$

<sup>1</sup> ABLIKIM 16B reports  $(1.94 \pm 0.42 \pm 0.64) \times 10^{-3}$  from a measurement of  $[\Gamma(\psi(3770) \rightarrow \gamma\chi_{c1})/\Gamma_{\text{total}}] / [B(\psi(2S) \rightarrow \gamma\chi_{c1}(1P))]$  assuming  $B(\psi(2S) \rightarrow \gamma\chi_{c1}(1P)) = (9.55 \pm 0.31) \times 10^{-2}$ , which we rescale to our best value  $B(\psi(2S) \rightarrow \gamma\chi_{c1}(1P)) = (9.75 \pm 0.24) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>2</sup> ABLIKIM 14H reports  $[\Gamma(\psi(3770) \rightarrow \gamma\chi_{c1})/\Gamma_{\text{total}}] \times [B(\chi_{c1}(1P) \rightarrow K_S^0 K^\pm \pi^\mp)] = (8.51 \pm 2.39 \pm 1.42) \times 10^{-6}$  which we divide by our best value  $B(\chi_{c1}(1P) \rightarrow K_S^0 K^\pm \pi^\mp) = 0.00349 \pm 0.00029$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. We have calculated the best value of  $B(\chi_{c1}(1P) \rightarrow K_S^0 K^\pm \pi^\mp)$  as 1/2 of  $B(\chi_{c1}(1P) \rightarrow \bar{K}^0 K^+ \pi^- + \text{c.c.}) = (7.0 \pm 0.6) \times 10^{-3}$ .

<sup>3</sup> Averages the two measurements from COAN 06A and BRIERE 06.

<sup>4</sup> Uses  $B(\psi(2S) \rightarrow \gamma\chi_{c1}) = 9.07 \pm 0.11 \pm 0.54\%$  from ATHAR 04,  $\psi(2S)$  mass and width from PDG 04, and  $\Gamma_{ee}(\psi(2S)) = 2.54 \pm 0.03 \pm 0.11$  keV from ADAM 06.

<sup>5</sup> Using  $\Gamma_{ee}(\psi(2S)) = (2.54 \pm 0.03 \pm 0.11)$  keV from ADAM 06 and taking  $\sigma(e^+ e^- \rightarrow D\bar{D})$  from HE 05 for  $\sigma(e^+ e^- \rightarrow \psi(3770))$ .

$\psi_2(3823)$ 
 $I^G(J^{PC}) = 0^-(2^{--})$   
 $I, J, P$  need confirmation.
was  $\psi(3823)$ ,  $X(3823)$ 

Seen by BHARDWAJ 13 in  $B \rightarrow \chi_{c1} \gamma K$  and ABLIKIM 15S in  $e^+ e^- \rightarrow \pi^+ \pi^- \gamma \chi_{c1}$  decays as a narrow peak in the invariant mass distribution of the  $\chi_{c1} \gamma$  system. Properties consistent with the  $\psi_2(1^3D_2)$   $c\bar{c}$  state.

$\chi_{c0}(3860)$

$$I^G(J^{PC}) = 0^+(0^{++})$$

OMITTED FROM SUMMARY TABLE  
The assignment  $J^P = 0^+$  is preferred over  $2^+$  by 2.5 sigma.  
Observed by CHILIKIN 17 using full amplitude analysis of the process  
 $e^+e^- \rightarrow J/\psi D\bar{D}$ , where  $D = D^0, D^+$ .

$\chi_{c1}(3872)$ 

$$J^G(J^{PC}) = 0^+(1^{++})$$

also known as  $X(3872)$ 

This state shows properties different from a conventional  $q\bar{q}$  state.  
A candidate for an exotic structure. See the review on non- $q\bar{q}$  states.

First observed by CHOI 03 in  $B \rightarrow K\pi^+\pi^- J/\psi(1S)$  decays as a narrow peak in the invariant mass distribution of the  $\pi^+\pi^- J/\psi(1S)$  final state. Isovector hypothesis excluded by AUBERT 05B and CHOI 11.

AAIJ 13Q perform a full five-dimensional amplitude analysis of the angular correlations between the decay products in  $B^+ \rightarrow \chi_{c1}(3872)K^+$  decays, where  $\chi_{c1}(3872) \rightarrow J/\psi\pi^+\pi^-$  and  $J/\psi \rightarrow \mu^+\mu^-$ , which unambiguously gives the  $J^{PC} = 1^{++}$  assignment under the assumption that the  $\pi^+\pi^-$  and  $J/\psi$  are in an  $S$ -wave. AAIJ 15AO extend this analysis with more data to limit  $D$ -wave contributions to  $< 4\%$  at 95% CL.

See the review on "Spectroscopy of Mesons Containing Two Heavy Quarks."

<sup>1</sup> Calculated from  $m_{\chi_{c1}(3872)} - m_{\psi(2S)} = 185.54 \pm 0.06$  MeV obtained by combining the data with  $\chi_{c1}(3872)$  produced in  $B^+$  decays from AAIJ 20S and inclusive  $b$ -hadron decays from AAIJ 20AD and using  $m_{\psi(2S)} = 3686.097$  MeV. Breit-Wigner parametrization.

<sup>2</sup> The mass difference for the  $\chi_{c1}(3872)$  produced in  $B^+$  and  $B^0$  decays is  $(-0.71 \pm 0.96 \pm 0.19)$  MeV.

<sup>3</sup> Width consistent with detector resolution.

<sup>4</sup> A possible equal mixture of two states with a mass difference greater than 3.6 MeV/ $c^2$  is excluded at 95% CL.

<sup>5</sup> Calculated from the corresponding  $m_{\chi_{c1}(3872)} - m_{J/\psi}$  using  $m_{J/\psi} = 3096.916$  MeV.

**$Z_c(3900)$** 

$$J^G(J^{PC}) = 1^+(1^{+-})$$

was  $X(3900)$ 

Properties incompatible with a  $q\bar{q}$  structure (exotic state). See the review on non- $q\bar{q}$  states.

Charged  $Z_c(3900)$  seen as a peak in the invariant mass distribution of the  $J/\psi\pi^\pm$  system by BES III (ABLIKIM 13T) in  $e^+e^- \rightarrow \pi^+\pi^- J/\psi$  at c.m. energy of 4.26 GeV and by radiative return from  $e^+e^-$  collisions at  $\sqrt{s}$  from 9.46 to 10.86 GeV at Belle (LIU 13B). Partial wave analysis of ABLIKIM 17J determines  $J^P = 1^+$  with more than  $7\sigma$  significance. Neutral  $Z_c(3900)$  seen in the  $J/\psi\pi^0$  invariant mass distribution in  $e^+e^- \rightarrow \pi^0\pi^0 J/\psi$  at c.m. energies of 4.23, 4.26, and 4.36 GeV by BES III (ABLIKIM 15U) and at 4.17 GeV by XIAO 13A. Peaks in  $(D\bar{D}^*)^{0,\pm}$  reported by BES III (ABLIKIM 14A, ABLIKIM 15AB) are assumed to be related.

<sup>1</sup> Pole mass obtained from a fit to a relativistic Breit-Wigner.

<sup>2</sup> Neglecting interference between the  $Z_c(3900)$  and other processes.

<sup>3</sup> Measured in weak decays of  $b$ -flavored hadrons (nonprompt).

<sup>4</sup> Pole mass obtained from a fit to a Flatte-like formula.

<sup>5</sup> For  $M^2(\pi^+\pi^-) < 0.65 \text{ GeV}^2$ . Obtained by analyzing CLEO-c data but not authored by the CLEO Collaboration.

<sup>6</sup> The signal of the  $Z_c(3900)$  is correlated with a parent  $J/\psi\pi^+\pi^-$  system in the invariant mass range 4.2–4.7 GeV. Superseded by ABAZOV 19.

<sup>7</sup> Superseded by ABLIKIM 20N.

<sup>8</sup> Superseded by ABLIKIM 17J.

**X(3915)**

$$J^{PC} = 0^+(0 \text{ or } 2^{++})$$

was  $\chi_{c0}(3915)$ 

The experimental analysis prefers  $J^{PC} = 0^{++}$ . However, a re-analysis presented in ZHOU 15C shows that if helicity-2 dominance assumption is abandoned and a sizable helicity-0 component is allowed, a  $J^{PC} = 2^{++}$  assignment is possible.

<sup>1</sup> Obtained from the full amplitude analysis. Parameterized with the relativistic Breit-Wigner line shape.

<sup>2</sup>  $\omega J/\psi$  threshold enhancement fitted as an S-wave Breit-Wigner resonance.

<sup>3</sup> Could also be X(3940). Significance 3.1 $\sigma$ . Fit with additional resonance at 3963.7 ± 5.7 MeV, significance 3.4 $\sigma$ .

**$X(4020)^\pm$**

$I^G(J^{PC}) = 1^+(?^-)$

Properties incompatible with a  $q\bar{q}$  structure (exotic state). See the review on non- $q\bar{q}$  states.

NODE=M213

Charged  $X(4020)$  seen by ABLIKIM 13X from  $e^+e^- \rightarrow \pi^+\pi^-h_c(1P)$  at c.m. energy from 3.90 to 4.42 GeV as a peak in the invariant mass distribution of the  $\pi^\pm h_c(1P)$  system, and by ABLIKIM 14B from  $e^+e^- \rightarrow (D^*\bar{D}^*)^\pm\pi^\mp$  events in  $(D^*\bar{D}^*)^\pm$  mass. A neutral  $X(4020)$  seen by ABLIKIM 14P at three c.m. energies in the same range in  $e^+e^- \rightarrow \pi^0\pi^0h_c(1P)$  as a peak in the larger of the two masses recoiling against a  $\pi^0$ . ABLIKIM 15AA observes a  $5.9\sigma$  signal in  $(D^*\bar{D}^*)^0$  in  $e^+e^- \rightarrow (D^*\bar{D}^*)^0\pi^0$  events using collisions at two c.m. energies. Production rates and mass values support grouping neutral and charged  $X(4020)$  together as manifestations of a single  $I = 1$  particle.

NODE=M072W;LINKAGE=SE **$\psi(4040)$  DECAY MODES**

Due to the complexity of the  $c\bar{c}$  threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective  $\sqrt{s}$  near this particle’s central mass value, more (less) than  $2\sigma$  above zero, without regard to any peaking behavior in  $\sqrt{s}$  or absence thereof. See mode listing(s) for details and references.

OCCUR=2

<sup>9</sup> Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the  $\psi(3770)$ ,  $\psi(4040)$ ,  $\psi(4160)$ , and  $\psi(4415)$  resonances. Phase angle fixed in the fit to  $\delta = (130 \pm 46)^\circ$ .

NODE=M072W5;LINKAGE=AB

<sup>10</sup> Reanalysis of data presented in BAI 00 and BAI 02C. From a global fit over the center-of-mass energy 3.8–4.8 GeV covering the  $\psi(4040)$ ,  $\psi(4160)$  and  $\psi(4415)$  resonances and including interference effects. Four sets of solutions are obtained with the same fit quality, mass and total width, but with different  $e^+ e^-$  partial widths. We quote only the range of values.

NODE=M072W5;LINKAGE=MO

<sup>11</sup> From a fit to Crystal Ball (OSTERHELD 86) data.

$I^G(J^{PC}) = 1^-(?^{?+})$   
 $I, G, C$  need confirmation.

OMITTED FROM SUMMARY TABLE

Properties incompatible with a  $q\bar{q}$  structure (exotic state). See the review on non- $q\bar{q}$  states.

Observed by MIZUK 08 in the  $\pi^+\chi_{c1}(1P)$  invariant mass distribution in  $\bar{B}^0 \rightarrow K^-\pi^+\chi_{c1}(1P)$  decays. Not seen by LEES 12B in this same mode after accounting for  $K\pi$  resonant mass and angular structure.

$\chi_{c1}(4140)$ 

$$J^G(J^{PC}) = 0^+(1^{++})$$

was  $X(4140)$ 

This state shows properties different from a conventional  $q\bar{q}$  state.  
A candidate for an exotic structure. See the review on non- $q\bar{q}$  states.

Seen by AALTONEN 09AH, ABAZOV 14A, CHATRCHYAN 14M, AAIJ 17C in  $B^+ \rightarrow \chi_{c1} K^+$ ,  $\chi_{c1} \rightarrow J/\psi \phi$ , and by ABAZOV 15M separately in both prompt ( $4.7 \sigma$ ) and non-prompt ( $5.6 \sigma$ ) production in  $p\bar{p} \rightarrow J/\psi \phi + \text{anything}$ . Not seen by SHEN 10 in  $\gamma\gamma \rightarrow J/\psi \phi$  and ABLIKIM 15 in  $e^+e^- \rightarrow \gamma J/\psi \phi$  at  $\sqrt{s} = 4.23, 4.26, 4.36$  GeV.

NODE=M193R01

- From an amplitude analysis of the decay  $B^+ \rightarrow J/\psi\phi K^+$  with a significance of 8.4  $\sigma$ .
- Statistical significance of more than 6  $\sigma$ .
- ABAZOV 14A reports  $B(B^+ \rightarrow \chi_{c1}(4140) K^+ \rightarrow J/\psi\phi K^+)/B(B^+ \rightarrow J/\psi\phi K^+) = (19 \pm 7 \pm 4)\%$  with 3.1  $\sigma$  significance.
- From a fit assuming an S-wave relativistic Breit-Wigner shape above a three-body phase-space non-resonant component with statistical significance of more than 5  $\sigma$ .
- Statistical significance of 3.8  $\sigma$ .
- Reported  $\sigma(e^+e^- \rightarrow \gamma\chi_{c1}(4140)) \cdot B(\chi_{c1}(4140) \rightarrow J/\psi\phi) < 0.35, 0.28, \text{ and } 0.33$  pb at 4.23, 4.26, and 4.36 GeV, respectively, at 90% CL.
- Reported  $B(B^+ \rightarrow \chi_{c1}(4140) K^+) \cdot B(\chi_{c1}(4140) \rightarrow J/\psi\phi)/B(B^+ \rightarrow J/\psi\phi K^+) < 0.07$  at 90% CL.

<sup>1</sup> Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the  $\psi(3770)$ ,  $\psi(4040)$ ,  $\psi(4160)$ , and  $\psi(4415)$  resonances. Phase angle fixed in the fit to  $\delta = (293 \pm 57)^\circ$ .

<sup>2</sup> Reanalysis of data presented in BAI 00 and BAI 02C. From a global fit over the center-of-mass energy 3.8–4.8 GeV covering the  $\psi(4040)$ ,  $\psi(4160)$  and  $\psi(4415)$  resonances and including interference effects.

<sup>3</sup> From a fit to Crystal Ball (OSTERHELD 86) data.

<sup>4</sup> From a fit to BES (BAI 02C) data.

**$\psi(4160)$  DECAY MODES**

Due to the complexity of the  $c\bar{c}$  threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective  $\sqrt{s}$  near this particle’s central mass value, more (less) than  $2\sigma$  above zero, without regard to any peaking behavior in  $\sqrt{s}$  or absence thereof. See mode listing(s) for details and references.

<sup>1</sup> Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the  $\psi(3770)$ ,  $\psi(4040)$ ,  $\psi(4160)$ , and  $\psi(4415)$  resonances. Phase angle fixed in the fit to  $\delta = (293 \pm 57)^\circ$ .

<sup>2</sup> Reanalysis of data presented in BAI 00 and BAI 02C. From a global fit over the center-of-mass energy 3.8–4.8 GeV covering the  $\psi(4040)$ ,  $\psi(4160)$  and  $\psi(4415)$  resonances and including interference effects. Four sets of solutions are obtained with the same fit quality, mass and total width, but with different  $e^+e^-$  partial widths. We quote only the range of values.

<sup>3</sup> From a fit to Crystal Ball (OSTERHELD 86) data.

<sup>4</sup> From a fit to BES (BAI 02C) data.

$I^G(J^{PC}) = 1^+(1^{+-})$   
*I*, *G*, *C* need confirmation.

OMITTED FROM SUMMARY TABLE  
was  $X(4200)^\pm$

This state shows properties different from a conventional  $q\bar{q}$  state.  
A candidate for an exotic structure. See the review on non- $q\bar{q}$  states.

Reported by CHILIKIN 14 in  $J/\psi\pi^+$  at a significance of  $6.2\sigma$ . As-  
signments of  $0^-$ ,  $1^-$ ,  $2^-$ , and  $2^+$  excluded at  $6.1\sigma$ ,  $7.4\sigma$ ,  $4.4\sigma$ ,  
and  $7.0\sigma$  level, respectively. Needs confirmation.

$\psi(4230)$ 

$$I^G(J^{PC}) = 0^-(1^{--})$$

also known as  $Y(4230)$ ; was  $X(4230)$

The recent measurement of  $e^+e^- \rightarrow J/\psi\pi\pi$  (ABLIKIM 17B) led to a downward shift in the mass of the  $\psi(4260)$ , also known as  $Y(4260)$ , such that a distinction between the  $\psi(4260)$  and  $\psi(4230)$  no longer appears justified. Therefore, starting from this edition, we include the data of ABLIKIM 17B in this node and have listed the  $\psi(4230)$  in the summary tables instead of the  $\psi(4260)$ .

 **$\psi(4260)$** 

$$J^{PC} = 0^{-}(1^{-}-)$$

OMITTED FROM SUMMARY TABLE

also known as  $Y(4260)$ ; was  $X(4260)$ 

The state  $\psi(4260)$  received its mass label from a Breit-Wigner (BW) fit to the  $J/\psi\pi\pi$  data listed below. The symmetric BW placed the mass unavoidably into the center of the distribution. The most recent measurement in the 4260 MeV mass range in the same channel (ABLIKIM 17B), however, revealed that the distribution is asymmetric and that the state has a much lower mass consistent with the entry for particle  $\psi(4230)$ . Thus, in this edition we merged the measurement of ABLIKIM 17B with the  $\psi(4230)$  node and labeled the older measurements of this node as not used. For details see the review on "Spectroscopy of mesons containing two heavy quarks."

$\chi_{c1}(4274)$

$I^G(J^{PC}) = 0^+(1^{++})$

NODE=M233

was  $X(4274)$

This state shows properties different from a conventional  $q\bar{q}$  state.  
A candidate for an exotic structure. See the review on non- $q\bar{q}$  states.

NODE=M233

Seen by AAIJ 17C in  $B^+ \rightarrow \chi_{c1} K^+$ ,  $\chi_{c1} \rightarrow J/\psi \phi$  using an amplitude analysis of  $B^+ \rightarrow J/\psi \phi K^+$  with a significance (accounting for systematic uncertainties) of  $6.0 \sigma$ .

**$\psi(4360)$** 

$$I^G(J^{PC}) = 0^-(1^{--})$$

also known as  $Y(4360)$ ; was  $X(4360)$

This state shows properties different from a conventional  $q\bar{q}$  state.  
A candidate for an exotic structure. See the review on non- $q\bar{q}$  states.

Seen in radiative return from  $e^+e^-$  collisions at  $\sqrt{s} = 9.54\text{--}10.58$  GeV by AUBERT 07S, WANG 07D, and LEES 14F. See also the review on "Spectroscopy of mesons containing two heavy quarks."

<sup>1</sup> From a three-resonance fit.

<sup>2</sup> From a fit to the cross section for  $e^+e^- \rightarrow \pi^+\pi^- \psi(2S) \rightarrow 2(\pi^+\pi^-)\ell^+\ell^-$  obtained from 16 center-of-mass energies between 4.008 and 4.600 GeV and comprising 5.1 fb<sup>-1</sup>.

<sup>3</sup> From a two-resonance fit. Supersedes WANG 07D.

<sup>4</sup> From a two-resonance fit.

<sup>5</sup> From a three-resonance fit.

<sup>6</sup> From a combined fit of BELLE, BABAR and BES3  $e^+e^- \rightarrow \pi^+\pi^- J/\psi$  and  $e^+e^- \rightarrow \pi^+\pi^- \psi(2S)$  data.

<sup>7</sup> From a combined fit of AUBERT 07S and WANG 07D data with two resonances.

<sup>8</sup> From a single-resonance fit. Systematic errors not estimated.

**$\psi(4415)$  DECAY MODES**

Due to the complexity of the  $c\bar{c}$  threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective  $\sqrt{s}$  near this particle’s central mass value, more (less) than  $2\sigma$  above zero, without regard to any peaking behavior in  $\sqrt{s}$  or absence thereof. See mode listing(s) for details and references.

<sup>11</sup> Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the  $\psi(3770)$ ,  $\psi(4040)$ ,  $\psi(4160)$ , and  $\psi(4415)$  resonances. Phase angle fixed in the fit to  $\delta = (234 \pm 88)^\circ$ .

<sup>12</sup> Reanalysis of data presented in BAI 00 and BAI 02C. From a global fit over the center-of-mass energy 3.8–4.8 GeV covering the  $\psi(4040)$ ,  $\psi(4160)$  and  $\psi(4415)$  resonances and including interference effects. Four sets of solutions are obtained with the same fit quality, mass and total width, but with different  $e^+e^-$  partial widths. We quote only the range of values.

<sup>13</sup> From a fit to Crystal Ball (OSTERHELD 86) data.

<sup>14</sup> From a fit to BES (BAI 02C) data.

**$Z_c(4430)$**

$$I^G(J^{PC}) = 1^+(1^{+-})$$

$G, C$  need confirmation.

was  $X(4430)^\pm$

Properties incompatible with a  $q\bar{q}$  structure (exotic state). See the review on non- $q\bar{q}$  states.

NODE=M195

First seen by CHOI 08 in  $B \rightarrow K\pi^+\psi(2S)$  decays, confirmed by AAIJ 14AG, and confirmed in a model-independent way by AAIJ 15BH. Also seen by CHILIKIN 14 in  $B \rightarrow K^+\pi J/\psi$  decays.  $J^P$  was determined by CHILIKIN 13 and AAIJ 14AG.

# $b\bar{b}$ MESONS (including possibly non- $q\bar{q}$ states)

NODE=MXXX030

NODE=M849

Updated August 2019.

The level scheme of meson states containing a minimal quark content of  $b\bar{b}$ . The name of a state is determined by its quantum numbers  $I^G J^{PC}$  (see the review “Naming Scheme for Hadrons”). States included in the Summary Tables are shown with solid lines; those requiring confirmation are shown with dotted lines. The arrows indicate the most dominant hadronic transitions. Single photon transitions, including  $\Upsilon(nS) \rightarrow \gamma \eta_b(mS)$ ,  $\Upsilon(nS) \rightarrow \gamma \chi_{bJ}(mP)$ , and  $\chi_{bJ}(nP) \rightarrow \gamma \Upsilon(mS)$ , are omitted for clarity. For orientation, the location of the thresholds related to a pair of ground state open bottom mesons is indicated in the figure.

NODE=M849

## WIDTH DETERMINATIONS OF THE $\Upsilon$ STATES

As is the case for the  $J/\psi(1S)$  and  $\psi(2S)$ , the full widths of the  $b\bar{b}$  states  $\Upsilon(1S)$ ,  $\Upsilon(2S)$ , and  $\Upsilon(3S)$  are not directly measurable, since they are much narrower than the energy resolution of the  $e^+e^-$  storage rings where these states are produced. The common indirect method to determine  $\Gamma$  starts from

$$\Gamma = \Gamma_{\ell\ell}/B_{\ell\ell} , \quad (1)$$

where  $\Gamma_{\ell\ell}$  is one leptonic partial width and  $B_{\ell\ell}$  is the corresponding branching fraction ( $\ell = e, \mu$ , or  $\tau$ ). One then assumes  $e$ - $\mu$ - $\tau$  universality and uses

$$\begin{aligned}\Gamma_{\ell\ell} &= \Gamma_{ee} \\ B_{\ell\ell} &= \text{average of } B_{ee}, B_{\mu\mu}, \text{ and } B_{\tau\tau} .\end{aligned}\quad (2)$$

The electronic partial width  $\Gamma_{ee}$  is also not directly measurable at  $e^+e^-$  storage rings, only in the combination  $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$ , where  $\Gamma_{\text{had}}$  is the hadronic partial width and

$$\Gamma_{\text{had}} + 3\Gamma_{ee} = \Gamma . \quad (3)$$

This combination is obtained experimentally from the energy-integrated hadronic cross section

$$\begin{aligned}\int_{\text{resonance}} \sigma(e^+e^- \rightarrow \Upsilon \rightarrow \text{hadrons})dE \\ = \frac{6\pi^2}{M^2} \frac{\Gamma_{ee}\Gamma_{\text{had}}}{\Gamma} C_r = \frac{6\pi^2}{M^2} \frac{\Gamma_{ee}^{(0)}\Gamma_{\text{had}}}{\Gamma} C_r^{(0)} ,\end{aligned}\quad (4)$$

where  $M$  is the  $\Upsilon$  mass, and  $C_r$  and  $C_r^{(0)}$  are radiative correction factors.  $C_r$  is used for obtaining  $\Gamma_{ee}$  as defined in Eq. (1), and contains corrections from all orders of QED for describing  $(b\bar{b}) \rightarrow e^+e^-$ . The lowest order QED value  $\Gamma_{ee}^{(0)}$ , relevant for comparison with potential-model calculations, is defined by the lowest order QED graph (Born term) alone, and is about 7% lower than  $\Gamma_{ee}$ .

The Listings give experimental results on  $B_{ee}$ ,  $B_{\mu\mu}$ ,  $B_{\tau\tau}$ , and  $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$ . The entries of the last quantity have been re-evaluated consistently using the correction procedure of KURA EV 85 [1]. The partial width  $\Gamma_{ee}$  is obtained from the average values for  $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$  and  $B_{\ell\ell}$  using

$$\Gamma_{ee} = \frac{\Gamma_{ee}\Gamma_{\text{had}}}{\Gamma(1 - 3B_{\ell\ell})} . \quad (5)$$

The total width  $\Gamma$  is then obtained from Eq. (1). We do not list  $\Gamma_{ee}$  and  $\Gamma$  values of individual experiments. The  $\Gamma_{ee}$  values in the Meson Summary Table are also those defined in Eq. (1).

NODE=M171M2

<sup>1</sup> With floating width. Not independent of the corresponding mass measurement.

<sup>2</sup> Assuming  $\Gamma_{\eta_b(1S)} = 10$  MeV. Not independent of the corresponding  $\gamma$  energy or mass measurements.

<sup>3</sup> Obtained by analyzing CLEO III data but not authored by the CLEO Collaboration.

<sup>1</sup> BESSON 07 reports  $[\Gamma(\Upsilon(1S) \rightarrow \tau^+\tau^-) / \Gamma_{\text{total}}] / [B(\Upsilon(1S) \rightarrow \mu^+\mu^-)] = 1.02 \pm 0.02 \pm 0.05$  which we multiply by our best value  $B(\Upsilon(1S) \rightarrow \mu^+\mu^-) = (2.48 \pm 0.05) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

NODE=M049R3;LINKAGE=BE

<sup>2</sup> Using  $B(\Upsilon(1S) \rightarrow ee) = B(\Upsilon(1S) \rightarrow \mu\mu) = 0.0256$ ; not used for width evaluations.

 $e^+e^- \rightarrow \text{hadrons}$ 

<sup>1</sup> For a tetraquark state  $\chi_{tetra}$ , with mass in the range 1.16–2.46 GeV and width in the range 0–0.3 GeV. Measured 90% CL limits as a function of  $\chi_{tetra}$  mass and width range from  $4.4 \times 10^{-6}$  to  $37.8 \times 10^{-6}$ .

|----------|----|-----------------------|----------|-------------------------------------------|
| $< 14$   | 90 | <sup>3</sup> FULTON   | 90B CLEO | $\Upsilon(1S) \rightarrow \gamma K^+ K^-$ |
| $< 19.4$ | 90 | <sup>3</sup> ALBRECHT | 89 ARG   | $\Upsilon(1S) \rightarrow \gamma K^+ K^-$ |

<sup>1</sup> Using  $B(f'_2(1525) \rightarrow K \bar{K}) = 0.887 \pm 0.022$  and  $B(K^0 \bar{K}^0) = 1/2 B(K \bar{K})$ .

<sup>2</sup> BESSON 11 reports  $(4.0 \pm 1.3 \pm 0.6) \times 10^{-5}$  from a measurement of  $[\Gamma(\Upsilon(1S) \rightarrow \gamma f'_2(1525))/\Gamma_{\text{total}}] \times [B(f'_2(1525) \rightarrow K \bar{K})]$  assuming  $B(f'_2(1525) \rightarrow K \bar{K}) = (88.8 \pm 3.1) \times 10^{-2}$ , which we rescale to our best value  $B(f'_2(1525) \rightarrow K \bar{K}) = (87.6 \pm 2.2) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value. The result also assumes  $B(K_S^0 \rightarrow \pi^+ \pi^-) = (69.20 \pm 0.05)\%$  and  $B(f'_2(1525) \rightarrow K \bar{K}) = 4 B(f'_2(1525) \rightarrow K_S^0 K_S^0)$ .

<sup>3</sup> Assuming  $B(f'_2(1525) \rightarrow K \bar{K}) = 0.71$ .

$\chi_{b0}(1P)$ 

$$J^G(J^{PC}) = 0^+(0^{++})$$

$J$  needs confirmation.

Observed in radiative decay of the  $\Upsilon(2S)$ , therefore  $C = +$ . Branching ratio requires E1 transition, M1 is strongly disfavored, therefore  $P = +$ .

| <11   | 90 | PAUSS             | 83  | CUSB | $\Upsilon(2S) \rightarrow \gamma\gamma\ell^+\ell^-$ |

<sup>1</sup> LEES 14M quotes  $\Gamma(\chi_{b0}(1P) \rightarrow \gamma\Upsilon(1S))/\Gamma_{\text{total}} \times \Gamma(\Upsilon(2S) \rightarrow \gamma\chi_{b0}(1P))/\Gamma_{\text{total}}$   
 $= (7.75 \pm 0.91) \times 10^{-4}$  combining the results from samples of  $\Upsilon(2S) \rightarrow \gamma\gamma\mu^+\mu^-$   
 with and without converted photons. Assumes  $B(\Upsilon(1S) \rightarrow \mu^+\mu^-) = (2.48 \pm 0.05)\%$ .

<sup>2</sup> LEES 14M reports  $[\Gamma(\chi_{b0}(1P) \rightarrow \gamma\Upsilon(1S))/\Gamma_{\text{total}}] \times [B(\Upsilon(2S) \rightarrow \gamma\chi_{b0}(1P))]$   
 $= (7.75 \pm 0.91) \times 10^{-4}$  which we divide by our best value  $B(\Upsilon(2S) \rightarrow \gamma\chi_{b0}(1P)) =$   
 $(3.8 \pm 0.4) \times 10^{-2}$ . Our first error is their experiment's error and our second error is  
 the systematic error from using our best value.

<sup>3</sup> Assuming  $B(\Upsilon(1S) \rightarrow \ell^+\ell^-) = (2.48 \pm 0.05)\%$ .

<sup>4</sup> KORNICER 11 reports  $[\Gamma(\chi_{b0}(1P) \rightarrow \gamma\Upsilon(1S))/\Gamma_{\text{total}}] \times [B(\Upsilon(2S) \rightarrow \gamma\chi_{b0}(1P))]$   
 $= (6.59 \pm 0.96 \pm 0.60) \times 10^{-4}$  which we divide by our best value  $B(\Upsilon(2S) \rightarrow \gamma\chi_{b0}(1P)) =$   
 $(3.8 \pm 0.4) \times 10^{-2}$ . Our first error is their experiment's error and our second error is  
 the systematic error from using our best value.

<sup>5</sup> LEES 11J quotes a central value of  $\Gamma(\chi_{b0}(1P) \rightarrow \gamma\Upsilon(1S))/\Gamma_{\text{total}} \times \Gamma(\Upsilon(2S) \rightarrow$   
 $\gamma\chi_{b0}(1P))/\Gamma_{\text{total}} = (8.3 \pm 5.6^{+3.7}_{-2.6}) \times 10^{-4}$ .

$\chi_{b1}(1P)$ 

$$J^G(J^{PC}) = 0^+(1^{++})$$

$J$  needs confirmation.

Observed in radiative decay of the  $\Upsilon(2S)$ , therefore  $C = +$ . Branching ratio requires E1 transition, M1 is strongly disfavored, therefore  $P = +$ .  $J = 1$  from SKWARNICKI 87.

$\chi_{b2}(1P)$ 

$$I^G(J^{PC}) = 0^+(2^{++})$$

$J$  needs confirmation.

Observed in radiative decay of the  $\Upsilon(2S)$ , therefore  $C = +$ . Branching ratio requires E1 transition, M1 is strongly disfavored, therefore  $P = +$ .  $J = 2$  from SKWARNICKI 87.

|----------------------------|------------|------------------------|----|---------------------------------------------------|
| 9974.6 $\pm$ 2.3 $\pm$ 2.1 | 11 $\pm$ 4 | <sup>2,3,4</sup> DOBBS | 12 | $\Upsilon(2S) \rightarrow \gamma \text{ hadrons}$ |
|----------------------------|------------|------------------------|----|---------------------------------------------------|

<sup>1</sup> Assuming  $\Gamma_{\eta_b(2S)} = 4.9$  MeV. Not independent of the corresponding mass difference measurement.

<sup>2</sup> SANDILYA 13 (Belle Collab.) search for such a state reconstructed in the same 26 exclusive hadronic final states as DOBBS 12 using a sample of  $(157.8 \pm 3.6) \times 10^6$   $\Upsilon(2S)$  decays or about 17 times larger and find no evidence for a signal. Their 90% C.L. upper limit on the branching fraction  $B(\Upsilon(2S) \rightarrow \eta_b(2S) \gamma) \times \sum_i B(\eta_b(2S) \rightarrow X_i) < 4.9 \times 10^{-6}$ , summed over the exclusive hadronic final states  $X_i$ , is an order of magnitude smaller than that reported by DOBBS 12.

<sup>3</sup> Obtained by analyzing CLEO III data but not authored by the CLEO Collaboration.

<sup>4</sup> Assuming  $\Gamma_{\eta_b(2S)} = 5$  MeV. Not independent of the corresponding mass difference measurement.

$$m_{\Upsilon(2S)} - m_{\eta_b(2S)}$$

| <sup>9</sup> SANDILYA 13 (Belle Collab.) search for such a state reconstructed in the same 26 exclusive hadronic final states as DOBBS 12 using a sample of $(157.8 \pm 3.6) \times 10^6$ $\Upsilon(2S)$ decays or about 17 times larger and find no evidence for a signal. Their 90% C.L. upper limit on the branching fraction $B(\Upsilon(2S) \rightarrow \eta_b(2S)\gamma) \times \sum_i B(\eta_b(2S) \rightarrow X_i) < 4.9 \times 10^{-6}$ , summed over the exclusive hadronic final states $X_i$ , is an order of magnitude smaller than that reported by DOBBS 12. |                 |             |      |                                                    |  |
| <sup>10</sup> Obtained by analyzing CLEO III data but not authored by the CLEO Collaboration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                 |             |      |                                                    |  |

**CONSTRAINED FIT INFORMATION**

An overall fit to 3 branching ratios uses 13 measurements and one constraint to determine 3 parameters. The overall fit has a  $\chi^2 = 11.8$  for 11 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients  $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$ , in percent, from the fit to the branching fractions,  $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$ . The fit constrains the  $x_i$  whose labels appear in this array to sum to one.

$$x_7 \quad \left| \quad \frac{2}{x_1} \right.$$

$\Upsilon_2(1D)$ 

$$J^{PC} = 0^-(2^--)$$

was  $\Upsilon(1D)$

First observed by BONVICINI 04 in the decay to  $\gamma\gamma \Upsilon(1S)$  and confirmed by DEL-AMO-SANCHEZ 10R in the decay to  $\pi^+\pi^- \Upsilon(1S)$ .

Data consistent with  $J^P = 2^-$ . The states with  $J = 1$  and 3 also possibly seen, but need confirmation.

$\chi_{b0}(2P)$ 

$$J^G(J^{PC}) = 0^+(0^{++})$$

$J$  needs confirmation.

Observed in radiative decay of the  $\Upsilon(3S)$ , therefore  $C = +$ . Branching ratio requires E1 transition, M1 is strongly disfavored, therefore  $P = +$ .

 $\chi_{b1}(2P)$ 
 $I^G(J^{PC}) = 0^+(1^{++})$ 

J needs confirmation.

Observed in radiative decay of the  $\Upsilon(3S)$ , therefore  $C = +$ . Branching ratio requires E1 transition, M1 is strongly disfavored, therefore  $P = +$ .

$\chi_{b2}(2P)$ 

$$I^G(J^{PC}) = 0^+(2^{++})$$

$J$  needs confirmation.

Observed in radiative decay of the  $\Upsilon(3S)$ , therefore  $C = +$ . Branching ratio requires E1 transition, M1 is strongly disfavored, therefore  $P = +$ .

NODE=M206

$$\chi_{b1}(3P)$$

$$I^G(J^{PC}) = 0^+(1^{++})$$

Needs confirmation.

NODE=M206

Observed in the radiative decay to  $\Upsilon(1S, 2S, 3S)$ , therefore  $C = +$ .  
 $J$  needs confirmation.

### $\chi_{b1}(3P)$ MASS

NODE=M206M

<sup>1</sup> Systematic error includes an additional 0.5 MeV for the uncertainty on the  $\Upsilon(3S)$  mass. Also measures  $m_{\chi_{b2}(3P)} - m_{\chi_{b1}(3P)} = 10.60 \pm 0.64 \pm 0.17$  MeV. A total of 372  $\chi_{b1}(3P)$  and  $\chi_{b2}(3P)$  events was observed.

<sup>2</sup> From  $\chi_{b1}(3P) \rightarrow \Upsilon(1S, 2S)\gamma$  transitions assuming  $m_{\chi_{b2}(3P)} - m_{\chi_{b1}(3P)} = 10.5 \pm 1.5$  MeV and allowing for  $\pm 30\%$  variation in the  $\chi_{b2}(3P)$  production rate relative to that of  $\chi_{b1}(3P)$ .

<sup>3</sup> The mass of the  $\chi_{b1}(3P)$  state obtained by combining the results of AAIJ 14BG with that of AAIJ 14BI. The first uncertainty is experimental and the second attributable to the unknown mass splitting, assumed to be  $m_{\chi_{b2}(3P)} - m_{\chi_{b1}(3P)} = 10.5 \pm 1.5$  MeV.

<sup>4</sup> From  $\chi_{b1}(3P) \rightarrow \Upsilon(3S)\gamma$  transition assuming  $m_{\chi_{b2}(3P)} - m_{\chi_{b1}(3P)} = 10.5 \pm 1.5$  MeV.

<sup>5</sup> The mass barycenter of the merged lineshapes from the  $J = 1$  and 2 states.

$$J^{PC} = 0^{+}(2^{++})$$

Needs confirmation.

NODE=M238

Observed in the radiative decay to  $\Upsilon(3S)$ , therefore  $C = +$ .  $J$  needs confirmation.

 $\Upsilon(4S)$  BRANCHING RATIOS $B\bar{B}$  DECAYS

The ratio of branching fraction to charged and neutral B mesons is often derived assuming isospin invariance in the decays, and relies on the knowledge of the  $B^+/B^0$  lifetime ratio. "OUR EVALUATION" is obtained based on averages of rescaled data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account the common dependence of the measurement on the value of the lifetime ratio.

<sup>1</sup> SOKOLOV 09 reports  $[\Gamma(\Upsilon(4S) \rightarrow \Upsilon(1S)\pi^+\pi^-)/\Gamma_{\text{total}}] \times [B(\Upsilon(1S) \rightarrow \mu^+\mu^-)] = (0.211 \pm 0.030 \pm 0.014) \times 10^{-5}$  which we divide by our best value  $B(\Upsilon(1S) \rightarrow \mu^+\mu^-) = (2.48 \pm 0.05) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>2</sup> Using  $B(\Upsilon(1S) \rightarrow e^+e^-) = (2.38 \pm 0.11)\%$  and  $B(\Upsilon(1S) \rightarrow \mu^+\mu^-) = (2.48 \pm 0.05)\%$ .

<sup>3</sup> SOKOLOV 07 reports  $[\Gamma(\Upsilon(4S) \rightarrow \Upsilon(1S)\pi^+\pi^-)/\Gamma_{\text{total}}] \times [B(\Upsilon(1S) \rightarrow \mu^+\mu^-)] = (4.42 \pm 0.81 \pm 0.56) \times 10^{-6}$  which we divide by our best value  $B(\Upsilon(1S) \rightarrow \mu^+\mu^-) = (2.48 \pm 0.05) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

<sup>4</sup> According to the authors, systematic errors were underestimated.

<sup>5</sup> Superseded by AUBERT 08BP. AUBERT 06R reports  $[\Gamma(\Upsilon(4S) \rightarrow \Upsilon(1S)\pi^+\pi^-)/\Gamma_{\text{total}}] \times [B(\Upsilon(1S) \rightarrow \mu^+\mu^-)] = (2.23 \pm 0.25 \pm 0.27) \times 10^{-6}$  which we divide by our best value  $B(\Upsilon(1S) \rightarrow \mu^+\mu^-) = (2.48 \pm 0.05) \times 10^{-2}$ . Our first error is their experiment's error and our second error is the systematic error from using our best value.

 **$Z_b(10610)$** 

$$I^G(J^{PC}) = 1^+(1^{+-})$$

was  $X(10610)$ 

Properties incompatible with a  $q\bar{q}$  structure (exotic state). See the review on non- $q\bar{q}$  states.

NODE=M207

NODE=M207

Observed by BONDAR 12 in  $\Upsilon(5S)$  decays to  $\Upsilon(nS)\pi^+\pi^-$  ( $n = 1, 2, 3$ ) and  $h_b(mP)\pi^+\pi^-$  ( $m = 1, 2$ ).  $J^P = 1^+$  is favored from angular analyses.

 **$Z_b(10610)^\pm$  MASS**

**$Z_b(10650)$**

$$J^G(J^{PC}) = 1^+(1^+ -)$$

$I, G, C$  need confirmation.

was  $X(10650)^\pm$

Properties incompatible with a  $q\bar{q}$  structure (exotic state). See the review on non- $q\bar{q}$  states.

NODE=M208

NODE=M208

Observed by BONDAR 12 in  $\Upsilon(5S)$  decays to  $\Upsilon(nS)\pi^+\pi^-$  ( $n = 1, 2, 3$ ) and  $h_b(mP)\pi^+\pi^-$  ( $m = 1, 2$ ).  $J^P = 1^+$  is favored from angular analyses.

|------------|------------------------|----|------------------------------------------|

<sup>1</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n = 1, 2, 3$ , cross sections at 28 energy points within  $\sqrt{s} = 10.6\text{--}11.05$  GeV, including the initial-state radiation at  $\Upsilon(10860)$ .

<sup>2</sup> From a simultaneous fit to the  $h_b(nP)\pi^+\pi^-$ ,  $n = 1, 2$  cross sections at 22 energy points within  $\sqrt{s} = 10.77\text{--}11.02$  GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , a single relative phase, a single relative amplitude, and two overall normalization factors, one for each  $n$ ). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.

<sup>3</sup> From a fit to the dressed cross sections of AUBERT 09E by BaBar and SANTEL 16 by Belle above 10.68 GeV with a coherent sum of a continuum amplitude and three Breit-Wigner functions with constant widths.

<sup>4</sup> From a fit to the total hadronic cross sections measured at 60 energy points within  $\sqrt{s} = 10.82\text{--}11.05$  GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with  $1/\sqrt{s}$  dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , one relative phase, and one decoherence coefficient).

<sup>5</sup> Not including uncertain and potentially large systematic errors due to assumed continuum amplitude  $1/\sqrt{s}$  dependence and related interference contributions.

<sup>6</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n = 1, 2, 3$ , cross sections at 25 energy points within  $\sqrt{s} = 10.6\text{--}11.05$  GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with fourteen resonance parameters (a mass, width, and three amplitudes for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , a single universal relative phase, and three decoherence coefficients, one for each  $n$ ). Continuum contributions were measured (and therefore fixed) to be zero.

<sup>7</sup> Superseded by MIZUK 19.

<sup>8</sup> In a model where a flat non-resonant  $b\bar{b}$ -continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.

<sup>9</sup> The parameters of the  $\Upsilon(11020)$  are fixed to those in AUBERT 09E.

- <sup>10</sup> In a model where a flat nonresonant  $\Upsilon(1S, 2S, 3S)\pi^+\pi^-$  continuum interferes with a single Breit-Wigner resonance.
- <sup>11</sup> In a model where a non-resonant  $b\bar{b}$ -continuum represented by a threshold function at  $\sqrt{s}=2m_B$  is incoherently added to a flat component interfering with two Breit-Wigner resonances. Not independent of other AUBERT 09E results. Systematic uncertainties not estimated.
- <sup>12</sup> Assuming four Gaussians with radiative tails and a single step in  $R$ .
- <sup>13</sup> In a coupled-channel model with three resonances and a smooth step in  $R$ .

<sup>1</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n = 1, 2, 3$ , cross sections at 28 energy points within  $\sqrt{s} = 10.6\text{--}11.05$  GeV, including the initial-state radiation at  $\Upsilon(10860)$ .

NODE=M092W;LINKAGE=F

<sup>2</sup> From a simultaneous fit to the  $h_b(nP)\pi^+\pi^-$ ,  $n = 1, 2$  cross sections at 22 energy points within  $\sqrt{s} = 10.77\text{--}11.02$  GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , a single relative phase, a single relative amplitude, and two overall normalization factors, one for each  $n$ ). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.

NODE=M092W;LINKAGE=D

<sup>3</sup> From a fit to the dressed cross sections of AUBERT 09E by BaBar and SANTEL 16 by Belle above 10.68 GeV with a coherent sum of a continuum amplitude and three Breit-Wigner functions with constant widths.

NODE=M092W;LINKAGE=G

<sup>4</sup> From a fit to the total hadronic cross sections measured at 60 energy points within  $\sqrt{s} = 10.82\text{--}11.05$  GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with  $1/\sqrt{s}$  dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , one relative phase, and one decoherence coefficient).

NODE=M092W;LINKAGE=A

<sup>5</sup> Not including uncertain and potentially large systematic errors due to assumed continuum amplitude  $1/\sqrt{s}$  dependence and related interference contributions.

NODE=M092W;LINKAGE=B

<sup>6</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n = 1, 2, 3$ , cross sections at 25 energy points within  $\sqrt{s} = 10.6\text{--}11.05$  GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with fourteen resonance parameters (a mass, width, and three amplitudes for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , a single universal relative phase, and three decoherence coefficients, one for each  $n$ ). Continuum contributions were measured (and therefore fixed) to be zero.

NODE=M092W;LINKAGE=C

<sup>7</sup> Superseded by MIZUK 19.

NODE=M092W;LINKAGE=E

<sup>8</sup> In a model where a flat non-resonant  $b\bar{b}$ -continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.

NODE=M092W;LINKAGE=AU

<sup>9</sup> The parameters of the  $\Upsilon(11020)$  are fixed to those in AUBERT 09E.

NODE=M092W;LINKAGE=CH

<sup>10</sup> In a model where a flat nonresonant  $\Upsilon(1S, 2S, 3S)\pi^+\pi^-$  continuum interferes with a single Breit-Wigner resonance.

NODE=M092W;LINKAGE=CE

<sup>11</sup> In a model where a non-resonant  $b\bar{b}$ -continuum represented by a threshold function at  $\sqrt{s}=2m_B$  is incoherently added to a flat component interfering with two Breit-Wigner resonances. Not independent of other AUBERT 09E results. Systematic uncertainties not estimated.

NODE=M092W;LINKAGE=UB

<sup>12</sup> Assuming four Gaussians with radiative tails and a single step in  $R$ .

NODE=M092W;LINKAGE=BE

<sup>13</sup> In a coupled-channel model with three resonances and a smooth step in  $R$ .

NODE=M092W;LINKAGE=LO

OCCUR=2

<sup>1</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n = 1, 2, 3$ , cross sections at 28 energy points within  $\sqrt{s} = 10.6\text{--}11.05$  GeV, including the initial-state radiation at  $\Upsilon(10860)$ .

NODE=M093M;LINKAGE=E

<sup>2</sup> From a simultaneous fit to the  $h_b(nP)\pi^+\pi^-$ ,  $n = 1, 2$  cross sections at 22 energy points within  $\sqrt{s} = 10.77\text{--}11.02$  GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , a single relative phase, a single relative amplitude, and two overall normalization factors, one for each  $n$ ). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.

NODE=M093M;LINKAGE=D

<sup>3</sup> From a fit to the dressed cross sections of AUBERT 09E by BaBar and SANTEL 16 by Belle above 10.68 GeV with a coherent sum of a continuum amplitude and three Breit-Wigner functions with constant widths.

NODE=M093M;LINKAGE=G

<sup>4</sup> From a fit to the total hadronic cross sections measured at 60 energy points within  $\sqrt{s} = 10.82\text{--}11.05$  GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with  $1/\sqrt{s}$  dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , one relative phase, and one decoherence coefficient).

NODE=M093M;LINKAGE=A

<sup>5</sup> Not including uncertain and potentially large systematic errors due to assumed continuum amplitude  $1/\sqrt{s}$  dependence and related interference contributions.

NODE=M093M;LINKAGE=B

<sup>6</sup> From a simultaneous fit to the  $\Upsilon(nS)\pi^+\pi^-$ ,  $n = 1, 2, 3$ , cross sections at 25 energy points within  $\sqrt{s} = 10.6\text{--}11.05$  GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with fourteen resonance parameters (a mass, width, and three amplitudes for each of  $\Upsilon(10860)$  and  $\Upsilon(11020)$ , a single universal relative phase, and three decoherence coefficients, one for each  $n$ ). Continuum contributions were measured (and therefore fixed) to be zero.

NODE=M093M;LINKAGE=C

<sup>7</sup> Superseded by MIZUK 19.

NODE=M093M;LINKAGE=F

<sup>8</sup> In a model where a flat non-resonant  $b\bar{b}$ -continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.
